TABLE 36

## LIFE TABLE FOR NEGRO FEMALES IN

BASED ON THE ESTIMATED MEAN POPULATION FOR THE 10-YEAR PERIOD 1901 TO 1910 (50,301), AND ON THE 1907 (1,338), IN 1908 (1,304), IN

NOTE.—An explanation of each column of the life tables is given on pages 25 to 29, and

| AGE INTERVAL. | OF 100,000 FEMALES BORN ALIVE:             |                                            | RATE OF MORTALITY PER THOUSAND. | COMPLETE EXPECTATION OF LIFE.                                                | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                                       |                                                    |                                                                    |
|---------------|--------------------------------------------|--------------------------------------------|---------------------------------|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|----------------------------------------------------|--------------------------------------------------------------------|
|               |                                            |                                            |                                 |                                                                              | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS. | DEATH RATE PER THOUSAND.                                           |
|               | Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval.   | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval.                                                                                                                            | Including only those in current month or year of age. | Population per death in age interval.              | Sum of numbers in column 6 in current and all older age intervals. |
| $x$ to $x+1$  | $l_x$                                      | $d_x$                                      | $1000q_x$                       | $e_x$                                                                        | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                                             | $T_x$                                              | $1000L_x/T_x$                                                      |
| 1             | 2                                          | 3                                          | 4                               | 5                                                                            | 6                                                                                                                                                                                                           | 7                                                     | 8                                                  | 9                                                                  |

| INFANT MORTALITY—FIRST YEAR OF LIFE BY AGE INTERVALS OF ONE MONTH. |         |       |               |           |       |            |           |              |

## THE STATE OF INDIANA: 1901.

## TABLE 37

REPORTED DEATHS IN 1900 (18,428), IN 1901 (18,022), AND IN 1902 (17,122).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                     | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                   | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                   | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                       | 7                                     | 8                                                                  | 9                                                                                            |

## THE STATE OF INDIANA: 1910.

## TABLE 38

REPORTED DEATHS IN 1909 (18,264), IN 1910 (19,251), AND IN 1911 (18,717).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                     | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                   | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                   | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                       | 7                                     | 8                                                                  | 9                                                                                            |

## THE STATE OF INDIANA: 1901.

## TABLE 39

REPORTED DEATHS IN 1900 (17,284), IN 1901 (17,108), AND IN 1902 (15,825).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE STATE OF INDIANA: 1910.

## TABLE 40

REPORTED DEATHS IN 1909 (16,255), IN 1910 (17,197), AND IN 1911 (16,493).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000l_x/T_x$                                                                                |

| 10-11                                                              |  |  |               |           |  |            |              |
| 11-12                                                              |  |  |               |           |  |            |              |

This life table is based on the estimated population December 31, 1889, and reported deaths for the census year ended May 31, 1890, shown in Table 179, page 470. The reported deaths are not in exact agreement with those published in the Massachusetts Registration Reports, but the differences are small except for the age under 1 year.

## STATE OF MASSACHUSETTS: 1890.

## TABLE 41

THE REPORTED DEATHS IN THE CENSUS YEAR ENDED MAY 31, 1890 (21,545).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |
|------------------|--------------------------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|

## STATE OF MASSACHUSETTS: 1901.

## TABLE 42

REPORTED DEATHS IN 1900 (26,050), IN 1901 (24,873), AND IN 1902 (24,312).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                    | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                  | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                  | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |

## STATE OF MASSACHUSETTS: 1910.

## TABLE 43

REPORTED DEATHS IN 1909 (26,255), IN 1910 (28,208), AND IN 1911 (27,515).

Illustrative examples, showing how to use the tables, are given on pages 29 to 40.

TABLE 44

## LIFE TABLE FOR FEMALES IN THE

BASED ON THE ESTIMATED POPULATION DECEMBER 1, 1889 (1,136,902), AND ON

NOTE.—An explanation of each column of the life tables is given on pages 25 to 29, and

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION, Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                      | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                    | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                    | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                        | 7                                     | 8                                                                  | 9                                                                                            |

| 11-12                                                              |  |  |               |           |  |            |  |              |

This life table is based on the estimated population December 31, 1889, and reported deaths for the census year ended May 31, 1890, shown in Table 179, page 470. The reported deaths are not in exact agreement with those published in the Massachusetts Registration Reports, but the differences are small except for the age under 1 year.

| LIFE TABLE FOR WHOLE RANGE OF LIFE BY AGE INTERVALS OF ONE YEAR. |         |        |              |           |        |           |           |              |
|------------------------------------------------------------------|---------|--------|--------------|-----------|--------|-----------|-----------|--------------|

## STATE OF MASSACHUSETTS: 1901.

## TABLE 45

REPORTED DEATHS IN 1900 (25,149), IN 1901 (23,332), AND IN 1902 (23,186).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## STATE OF MASSACHUSETTS: 1910.

## TABLE 46

REPORTED DEATHS IN 1909 (24,841), IN 1910 (26,093), AND IN 1911 (25,488).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |

## STATE OF MICHIGAN: 1901.

## TABLE 47

REPORTED DEATHS IN 1900 (18,130), IN 1901 (17,597), AND IN 1902 (17,016).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## STATE OF MICHIGAN: 1910.

## TABLE 48

REPORTED DEATHS IN 1909 (19,622), IN 1910 (21,724), AND IN 1911 (20,855).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 MALES BORN<br>ALIVE:                     |                                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND. | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                           | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                                                |                                                            |                                                                               |

## THE STATE OF MICHIGAN: 1901.

TABLE 49

REPORTED DEATHS IN 1900 (15,843), IN 1901 (15,255), AND IN 1902 (14,346).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $l_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                           | 7                                     | 8                                                                  | 9                                                                                            |

## THE STATE OF MICHIGAN: 1910.

## TABLE 50

REPORTED DEATHS IN 1909 (16,638), IN 1910 (18,164), AND IN 1911 (17,138).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |
|-----------------------------------------------------|--------------------------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|

## STATE OF NEW JERSEY: 1901.

TABLE 51

REPORTED DEATHS IN 1900 (17,904), IN 1901 (17,077), AND IN 1902 (17,071).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL. | OF 100,000 MALES BORN ALIVE:               |                                            | RATE OF MORTALITY PER THOUSAND. | COMPLETE EXPECTATION OF LIFE.                                                | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                                       |                                                    |                                                                    |
|---------------|--------------------------------------------|--------------------------------------------|---------------------------------|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|----------------------------------------------------|--------------------------------------------------------------------|
|               |                                            |                                            |                                 |                                                                              | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                     | MEASURE OF VITALITY.                                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS. | DEATH RATE PER THOUSAND.                                           |
|               | Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval.   | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval.                                                                                                                        | Including only those in current month or year of age. | Population per death in age interval.              | Sum of numbers in column 6 in current and all older age intervals. |
| $x$ to $x+1$  | $l_x$                                      | $d_x$                                      | $1000q_x$                       | $e_x$                                                                        | $L_x$                                                                                                                                                                                                   | $L_x/d_x$                                             | $T_x$                                              | $1000L_x/T_x$                                                      |
| 1             | 2                                          | 3                                          | 4                               | 5                                                                            | 6                                                                                                                                                                                                       | 7                                                     | 8                                                  | 9                                                                  |

## STATE OF NEW JERSEY: 1910.

## TABLE 52

REPORTED DEATHS IN 1909 (19,621), IN 1910 (21,223), AND IN 1911 (20,811).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

## THE STATE OF NEW JERSEY: 1901.

## TABLE 53

REPORTED DEATHS IN 1900 (15,535), IN 1901 (14,714), AND IN 1902 (14,311).

Illustrative examples, showing how to use the tables, are given on pages 29 to 40.

| AGE<br>INTERVAL. | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE STATE OF NEW JERSEY: 1910.

## TABLE 54

REPORTED DEATHS IN 1909 (16,689), IN 1910 (18,281), AND IN 1911 (17,806).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 FEMALES BORN<br>ALIVE:                   |                                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND. | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                           | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                                                |                                                            |                                                                               |

## THE STATE OF NEW YORK: 1901.

## TABLE 55

REPORTED DEATHS IN 1900 (69,687), IN 1901 (70,070), AND IN 1902 (66,841).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE STATE OF NEW YORK: 1910.

TABLE 56

REPORTED DEATHS IN 1909 (75,466), IN 1910 (79,664), AND IN 1911 (78,368).

Illustrative examples, showing how to use the tables, are given on pages 20 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |
|-----------------------------------------------------|--------------------------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
|                                                     |                                                  |                                  |                                                                                               |                                                                                              | POPULATION IN<br>CURRENT AGE<br>INTERVAL.                                                                                                                                                                  | MEASURE OF<br>VITALITY.                     | POPULATION IN CUR-<br>RENT AND ALL OLDER<br>AGE INTERVALS.                    | DEATH RATE<br>PER THOUSAND.                                                                                     |
| Period of<br>lifetime<br>between two<br>exact ages. | Number alive<br>at beginning of<br>age interval. | Number dying<br>in age interval. | Number dying<br>in age interval<br>among 1,000<br>alive at begin-<br>ning of age<br>interval. | Average length<br>of life remaining<br>to each one alive<br>at beginning of<br>age interval. | Including only<br>those in current<br>month or year<br>of age.                                                                                                                                             | Population<br>per death in<br>age interval. | Sum of numbers<br>in column 6 in cur-<br>rent and all older<br>age intervals. | Average annual<br>death rate per<br>thousand of pop-<br>ulation in cur-<br>rent and all older<br>age intervals. |

## THE STATE OF NEW YORK: 1901.

## TABLE 57

REPORTED DEATHS IN 1900 (62,665), IN 1901 (61,391), AND IN 1902 (57,816).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE STATE ON NEW YORK: 1910.

TABLE 58

REPORTED DEATHS IN 1909 (64,607), IN 1910 (68,014), AND IN 1911 (67,286).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

## THE CITY OF CHICAGO: 1901.

## TABLE 63

REPORTED DEATHS IN 1900 (14,382), IN 1901 (13,510), AND IN 1902 (14,991).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |
|-----------------------------------------------------|--------------------------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|

## THE CITY OF CHICAGO: 1910.

## TABLE 64

REPORTED DEATHS IN 1909 (17,871), IN 1910 (19,169), AND IN 1911 (18,947).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                     | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                   | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                   | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                       | 7                                     | 8                                                                  | 9                                                                                            |

## THE CITY OF CHICAGO: 1901.

## TABLE 65

REPORTED DEATHS IN 1900 (11,680), IN 1901 (10,968), AND IN 1902 (11,494).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |

## THE CITY OF CHICAGO: 1910.

## TABLE 66.

REPORTED DEATHS IN 1909 (13,425), IN 1910 (14,072), AND IN 1911 (13,584).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |

## THE CITY OF NEW YORK: 1901.

## TABLE 67

REPORTED DEATHS IN 1900 (38,029), IN 1901 (38,174), AND IN 1902 (36,899).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                     | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                   | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                   | $L_x/d_x$                             | $T_x$                                                              | $1000/L_x/T_x$                                                                               |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                       | 7                                     | 8                                                                  | 9                                                                                            |

## THE CITY OF NEW YORK: 1910.

## TABLE 68

REPORTED DEATHS IN 1909 (40,388), IN 1910 (41,763), AND IN 1911 (41,118).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE CITY OF NEW YORK: 1901.

## TABLE 69

REPORTED DEATHS IN 1900 (32,838), IN 1901 (32,434), AND IN 1902 (31,087).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $L_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |

## THE CITY OF NEW YORK: 1910.

## TABLE 70

REPORTED DEATHS IN 1909 (33,875), IN 1910 (35,024), AND IN 1911 (34,211).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                           | 7                                     | 8                                                                  | 9                                                                                            |

## CITY OF PHILADELPHIA: 1901.

## TABLE 71

REPORTED DEATHS IN 1900 (14,139), IN 1901 (12,200), AND IN 1902 (12,297).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE CITY OF PHILADELPHIA: 1901.

## TABLE 73

REPORTED DEATHS IN 1900 (12,836), IN 1901 (11,606), AND IN 1902 (11,281).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE CITY OF PHILADELPHIA: 1910.

## TABLE 74

REPORTED DEATHS IN 1909 (12,053), IN 1910 (12,790), AND IN 1911 (12,381).

Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## PART III

LIFE TABLES OF FOREIGN COUNTRIES

MORTALITY TABLES BASED ON EXPERIENCE OF LIFE INSURANCE COMPANIES

---

### PART III.—LIFE TABLES OF FOREIGN COUNTRIES.

#### FOREIGN COUNTRIES AND EPOCHS.

87. Life tables for twelve foreign countries are included in this part; the countries and the epochs for these tables are: Australia, 1901-1910; Denmark, 1906-1910; England, 1901-1910; France, 1898-1903; Germany, 1901-1910; Holland, 1900-1909; India, 1901-1910; Italy, 1901-1910; Japan, 1898-1903; Norway, 1901-1910; Sweden, 1901-1910; and Switzerland, 1901-1910. The United States life tables for white males and white females in the original registration states, 1901-1910, are shown for comparison with the life tables of these foreign countries. It will be observed that the countries are chosen which show mortality conditions in various sections of Europe. The life tables for India and Japan make it possible to compare mortality in this country and Europe with that of other races in the Orient. The life tables for Australia are the only ones given for persons living in the Southern Hemisphere. The tables are given by sex; those for males appear in Tables 75, 77, 79, 81, and 83, and those for females in Tables 76, 78, 80, 82, and 84, pages 204 to 223.

#### MORTALITY FUNCTIONS AND GRAPHS.

88. The mortality functions of foreign countries are not presented in the same form as the United States life tables. Only five of the columns appearing in the latter are shown for the life tables of foreign countries. These are the rate of mortality per thousand, the number of survivors out of 100,000 born alive, the number of deaths out of 100,000 born alive, the complete expectation of life,\* and the measure of vitality.†

In addition to the columns of figures giving the numerical values, graphs of the mortality functions are shown in Part IV. These graphs do not include curves for all the countries shown in the tables of mortality functions of foreign countries, but only for Australia,

England, Germany, India, Italy, Sweden, and the United States. In every case where graphs are shown the epoch covered is the decennium 1901-1910. These graphs make it easy to study the comparative rates of mortality, expectations of life, and other mortality functions of the different countries represented. The important differences and striking variations occurring in these tables and graphs are pointed out in sections 69-74 in the Questions and Answers of Part I of this text, page 44, which relate to foreign countries.

#### TABULAR FORM FACILITATES COMPARISON OF VALUES.

89. The values of the mortality functions of the foreign countries shown are taken from the published life tables of these countries,‡ based on their official population and death statistics, and are exhibited here in tabular form so that a comparison may be made at each age. For example, the rates of mortality per thousand for males in the twelve foreign countries and the United States are brought together on one page, so that it is easy to make a comparison of the rate of mortality at a given age in one country with that in any other country, or with that in the United States.

The number of survivors in all these tables is based upon the same radix, namely, 100,000 at birth. This enables one to tell the number of survivors at each age in every table and to make interesting comparisons between different countries. For example, a glance at Table 76, page 206, shows that in India less than half of the males born alive survive to age 11, while it is not until after age 58 in this country and age 65 in Sweden that half of the males born alive have died. Many interesting comparisons could be pointed out in connection with these tables and graphs, but the reader is referred for some of these to sections 69-74 in the Questions and Answers on pages 44 and 45.

\* The complete expectation of life, based on the graduated rates of mortality for Norway, was computed in the Bureau of the Census according to the formula  $\frac{1}{2} + \left( \sum_{x+1}^{\infty} l_x \right) / l_x$ . The  $l_x$  used to compute the values in Tables 81 and 82, pp. 216 to 219, were taken from Tables 77 and 78, respectively, pp. 208 to 211.

† The measure of vitality for the twelve foreign countries was computed in the Bureau of the Census according to the formula  $l_x/d_x - \frac{1}{2}$ . The  $l_x$  and  $d_x$  used to compute the values in Table 83, p. 220, were taken from Tables 77 and 79, pp. 208 and 212; those used to compute the values in Table 84, p. 222, from Tables 78 and 80, pp. 210 and 214. The values for the United States were copied from Tables 8 and 11, pp. 66 and 72 of this volume.

† Whites in the original registration states, which include Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, Michigan, and the District of Columbia.

# MORTALITY TABLES BASED ON EXPERIENCE OF LIFE INSURANCE COMPANIES.

## DESCRIPTION OF TABLES.

90. Four of these tables are based on experience for the most part on insured lives in the United States, one on that in the United States and Canada, while five others are based on experience on insured lives in Great Britain, France, Germany, Japan, and Sweden, respectively; the life table for white males in the original registration states, 1910, is based on census statistics.

The American Experience Mortality Table was constructed by Sheppard Homans about 1860 and was first published under its present name in a schedule attached to an act passed by the legislature of the state of New York in 1868. It has for its basis the experience on insured lives in the Mutual Life Insurance Company, of New York, but it is not an accurate representation of the individual experience of that company. The table was intended to represent the death rate among insured lives residing in healthful districts after the effects of medical selection were eliminated. It is quite generally prescribed by state laws for valuation purposes and is employed by practically all the old-line companies in this country to calculate their premiums and reserves and also by the United States Government for insurance on soldiers.

The Thirty American Offices Tables were compiled by Levi W. Meech and are based upon the experience of thirty American life insurance companies on insured lives. The experience closed with the year 1874. The tables were prepared with great care and in considerable detail, but they have never been used to any extent by insurance companies. The table included in this volume is for males.

The most recent investigation of mortality rates based upon the experience of insured lives in the United States and Canada is known as the American-Canadian Mortality Investigation. It was conducted by the Actuarial Society of America, with the cooperation of the American Institute of Actuaries and the National Convention of Insurance Commissioners, and was based on the experience of life insurance companies of the United States and Canada during the years 1900 to 1915, inclusive, with policies issued from 1843 to 1914, inclusive. This investigation undoubtedly shows very closely the rates of mortality now existing among insured lives in this country and Canada.

The table included in this volume is for American men and represents the experience on men who had been insured at least five years. It is what is known as a "truncated" table of mortality, the first five years of insurance having been excluded from the observations used in its construction. The result of excluding the first five years of insurance experience is practically to eliminate the effect of medical selection. The rates of mortality by this table are much lower than those shown by the American Experience or the Thirty American Offices Life Table for nearly all ages.

The symbol for the American-Canadian Table included in this volume is  $AM^{(s)}$ ; the  $AM$  denotes

American Men, and the superscript  $(s)$  denotes that it is a truncated table based on insured lives where the first five insurance years are excluded.

The British Offices Life Tables were prepared under the supervision of a joint committee of the Institute of Actuaries of Great Britain and the Faculty of Actuaries of Scotland. They comprise the experience of practically all the British and Scotch companies on insured lives during the period 1863-1893. The table included herein is based upon the experience with whole life participating insurance on men, and the symbol used to designate it is  $O^{M(s)}$ . The superscript  $(s)$  indicates that it is a truncated table, policies of duration of less than five years having been excluded from the observations used in its construction. This table is quite generally employed by life insurance companies in England and Canada for the calculation of premiums and reserves.

The Four French Offices Mortality Experience is based on the experience on insured lives in four French companies, and the observations extended from 1819 to the end of 1887. It includes the experience on both male and female lives, and is used at the present time by French insurance companies for the calculation of premiums and reserves. It is designated by the symbol  $AF$ , the  $A$  referring to Assurance and the  $F$  to French, the combination meaning French insurance. This table runs very near the British Offices Life Table from age 17 to about age 45, after which it shows higher mortality rates.

The Twenty-three German Offices Life Tables are based upon the experience on insured lives of twenty-three German life insurance companies. The experience closed in 1875 and included tables for male lives, female lives, and for both sexes combined. The table included in this volume and used by German life insurance companies is the one based on the combined experience on men and women. It shows rates of mortality considerably above those in the American Experience, American-Canadian, British Offices, and French Offices Tables.

The Three Japanese Offices Life Tables are based upon the experience on insured lives in three Japanese companies, the Neiji, established in 1881; the Teikoku, established in 1888; and the Nippon, established in 1888. The observations covered all their insured risks from date of organization to the close of 1905, with some exceptions in connection with military service and emigrants. The table included herein is based on the experience on insured Japanese men and is designated by the symbol  $J^{M(s)}$ . This indicates that it is a truncated table for Japanese males, the first five years of insurance experience having been excluded. This table is used by Japanese companies for the calculation of premiums and reserves. It shows a much higher mortality than any of the other insurance tables for most ages.

The Seventeen Swedish Offices Life Tables are based on insured lives from 1895 to 1906 in seventeen Swed-

ish life insurance companies. Numerous tables were constructed from this experience, some based on the medical examination as the unit, some on the amount insured as the unit, and some on the life insured. The table included is based on male lives, the person or life being the unit. It also includes the aggregate experience; in other words, it is not a truncated table. The symbol for this table is  $M_a^b$ ; M means that the table relates to men; the subscript  $a$  means that it is an aggregate table, including all years of insurance experience; the superscript  $b$ , that the person or life is the unit; and the superscript  $c$ , that the table in question is based on the entire experience on men and not on any special class of policies, as whole life policies alone or endowment policies alone.

The National Fraternal Congress Table of Mortality was prepared in 1898 by a joint committee appointed by the National Fraternal Congress, a representative association of fraternal societies in this country. According to the committee, "the experience examined and available embraced the mortality experience of old-line companies in the United States, England, Canada, and Australia; of the fraternal societies, the experience of the two oldest and largest in this country." This table is employed by many fraternal societies in this country as a basis for their assessment rates and to measure the present value of benefits promised in their certificates and the present value of the future contributions of their members. The rates of mortality are between those of the American-Canadian and the American Experience from age 20 to age 49, but from age 50 to age 80 they are lower than the rates in both these tables.

The Standard Industrial Mortality Table is based on the industrial insurance experience of the Metropolitan Life during the ten years 1896-1905. It has been adopted as the legal basis for industrial insurance in the state of New York and is employed by most of the industrial companies as a basis for their premiums and reserves. It is based on the entire experience on all the male lives and is an aggregate table, no insurance years having been excluded. The rates of mortality from age 2 to age 20 are somewhat higher than those in most of the census life tables and from age 30 to age 50 much higher than those in the other insurance tables; from age 50 to age 93 they run very close to those in the Three Japanese Offices Tables.

#### MORTALITY FUNCTIONS APPEARING IN TABLES AND GRAPHS.

91. Tables 85 to 89 on pages 226 to 235 exhibit the rate of mortality per thousand, the number of survivors out of 79,116 alive at age 20, the number of deaths out of 79,116 alive at age 20, the complete expectation of life,\* and the measure of vitality.† The common radix, 79,116, is the number of survivors at age 20 in the life table for white males in the original

registration states for 1910, and was chosen in order to compare the number of survivors and number of deaths in the various insurance tables. Tables 90 and 91 on pages 236 to 239 show the number of survivors and number of deaths out of the number alive according to the original radix of each table. (See sec. 77, p. 46.)

#### DIFFERENCE BETWEEN MORTALITY TABLES BASED ON INSURED LIVES AND LIFE TABLES BASED ON CENSUS STATISTICS.

92. It is shown in Part VI on the Mathematical Theory of Construction of Life Tables that the rates of mortality in the life tables are derived by the application of certain formulas to the original census statistics, that is, to the enumerated populations, the reported deaths, and the birth registration statistics. All persons living are taken into account, as well as all the births and deaths. The case is quite different in the construction of mortality tables based on insured lives. The individual does not come under observation until accepted as a risk by the insurance company. Before the policy is issued the applicant is required to pass a satisfactory medical examination, and this constitutes the chief distinction between the aggregate of policyholders in an insurance company and the aggregate of persons in the general unselected population. The former is said to constitute a selected group, the basis of selection being the medical examination. It has been found that the rates of mortality during the first five insurance years among insured lives are much lower than the rates of mortality at the same ages in the general population, and actuaries have shown that the effect of this medical selection does not entirely pass away until after ten or more years; some actuaries contend that its effect never entirely disappears. The effect of medical selection should be borne in mind when comparing insurance tables with census tables.

Attention has been called to some of the mortality tables which were constructed by excluding the first five insurance years from the observations, and it is evident that the truncated tables so obtained are more nearly comparable with census life tables because the effect of medical selection has been eliminated to some extent. Even in these cases, however, great caution should be used in making comparisons, because the composition of the general population is likely to be quite different from that of the policyholders in an insurance company. It should also be remembered, in comparing insurance tables, that they are not based on the same kind of experience; for example, some are aggregate tables, some truncated tables, some based on male lives, some on male and female lives, some based on the class of policyholders who take industrial insurance, and others on the class of policyholders who take the more expensive forms of insurance. In addition to all these varying factors some of the tables are based on insured lives in different countries.

\* The complete expectation of life for the Seventeen Swedish Offices Life Tables and for the Standard Industrial Mortality Tables was computed in the Bureau of the Census according to the formula  $\frac{1}{d_x} + \left( \sum_{t=1}^{\infty} l_{x+t} \right) / l_x$ . The  $l_x$  used to compute these values were taken from Table 90, p. 236.

† The measure of vitality for the ten tables based on insured lives was computed in the Bureau of the Census according to the formula  $l_x / d_x - \frac{1}{2}$ . The  $l_x$  and  $d_x$  used to compute the values in Table 89, p. 234, were taken from Tables 90 and 91, respectively, pp. 236 to 239. Those for the United States were taken from Table 9, p. 68.
