# UNITED STATES LIFE TABLES

1890, 1901, 1910, and 1901-1910

Explanatory Text, Mathematical Theory, Computations,  
Graphs, and Original Statistics

ALSO

Tables of United States Life Annuities  
Life Tables of Foreign Countries  
Mortality Tables of Life Insurance Companies

---

Prepared by JAMES W. GLOVER  
Expert Special Agent of the Bureau of the Census

WASHINGTON  
GOVERNMENT PRINTING OFFICE  
1921

## SUMMARY OF PARTS.

|                                                                                                                                                                                                                 | Page. |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| INTRODUCTION.....                                                                                                                                                                                               | 17    |
| I.—Nontechnical Description and Explanation of Life Table Functions, Graphs, and Other Parts of Text and Tables.....                                                                                            | 23    |
| II.—United States Life Tables: 1890, 1901, 1910, and 1901-1910.....                                                                                                                                             | 51    |
| III.—Life Tables of Foreign Countries and Mortality Tables Based on Experience of Life Insurance Companies.....                                                                                                 | 201   |
| IV.—Graphs of Life Table Functions.....                                                                                                                                                                         | 241   |
| V.—Tables of Life Annuities, Annual Premiums, Single Premiums, and Commutation Columns Based on Life Tables for White Males and for White Females in the Original Registration States: 1910.....                | 295   |
| VI.—Mathematical Theory of Construction of Life Tables.....                                                                                                                                                     | 327   |
| VII.—Description of Calculation of Life Table for Males in the State of New York, 1910, Including Photographs of Graphs, Diagrams, and Adding Machine Tapes Used in Connection with Numerical Computations..... | 367   |
| Tabular Outline for Construction of Each Life Table.....                                                                                                                                                        | 415   |
| VIII.—Original Statistics.....                                                                                                                                                                                  | 421   |
| INDEX.....                                                                                                                                                                                                      | 477   |

## DETAILED TABLE OF CONTENTS.

### INTRODUCTION.

| Section.                                                      | Page. | Section.                                                   | Page. |
|---------------------------------------------------------------|-------|------------------------------------------------------------|-------|
| 1. Division of text with reference to use of life tables..... | 17    | 9. Mortality in other countries.....                       | 19    |
| 2. Extent of life tables.....                                 | 17    | 10. Mortality tables of insurance companies.....           | 20    |
| 3. Infant mortality tables.....                               | 17    | 11. Life annuities, premiums, and commutation columns..... | 20    |
| 4. Policy adopted in construction of tables.....              | 18    | 12. Theory of life table construction.....                 | 20    |
| 5. Purpose of life tables.....                                | 18    | 13. Detailed construction of one life table.....           | 21    |
| 6. Questions and answers.....                                 | 18    | 14. Variations from standard construction.....             | 21    |
| 7. The United States life tables.....                         | 18    | 15. Original statistics.....                               | 21    |
| 8. Graphic representation of life tables.....                 | 19    |                                                            |       |

### PART I.—Nontechnical Description and Explanation of Life Table Functions, Graphs, and Other Parts of Text and Tables.

#### EXPLANATION OF LIFE TABLE FUNCTIONS.

| Section.                                         | Page. | Section.                                                                     | Page. |
|--------------------------------------------------|-------|------------------------------------------------------------------------------|-------|
| 16. Life table headings.....                     | 25    | 22. Population in current age interval, $L_x$ , column 6.....                | 27    |
| 17. Age interval, $x$ to $x+1$ , column 1.....   | 25    | 23. Measure of vitality, $\lambda_x = L_x/d_x$ , column 7.....               | 27    |
| GENERATION OF 100,000 BORN ALIVE.                |       | 24. Population in current and all older age intervals, $T_x$ , column 8..... | 28    |
| 18. Number of survivors, $l_x$ , column 2.....   | 25    | 25. Death rate per thousand, $1000l_x/T_x$ , column 9.....                   | 28    |
| 19. Number dying, $d_x$ , column 3.....          | 26    | 26. To determine average annual death rate per thousand.....                 | 29    |
| 20. Rate of mortality, $1000q_x$ , column 4..... | 26    |                                                                              |       |
| 21. Expectation of life, $e_x$ , column 5.....   | 26    |                                                                              |       |

#### QUESTIONS AND ANSWERS ILLUSTRATING USE OF TABLES AND GRAPHS.

| Section.                                                                    | Page. | Section.                                                                             | Page. |
|-----------------------------------------------------------------------------|-------|--------------------------------------------------------------------------------------|-------|
| 27. Scope and purpose of these questions and answers.....                   | 29    | RATES OF MORTALITY—continued.                                                        |       |
| RATES OF MORTALITY.                                                         |       | 38. Variation of rates of mortality with age.....                                    | 34    |
| 28. Annual rates of mortality.....                                          | 29    | 39. Comparison of mortality among whites and Negroes.....                            | 34    |
| 29. Graphic representation of rates of mortality.....                       | 29    | 40. Changes in rates of mortality in 1890-1901 compared with those in 1901-1910..... | 34    |
| 30. Annual rates of mortality under 1 year.....                             | 30    | 41. Rates of mortality in United States compared with those in other countries.....  | 34    |
| 31. Comparative rates of mortality.....                                     | 30    | NUMBER OF SURVIVORS.                                                                 |       |
| 32. Characteristic changes in rates among males.....                        | 31    | 42. Number of survivors of a generation of 100,000 born alive.....                   | 35    |
| 33. Monthly rates of mortality.....                                         | 31    | 43. Variation of number of survivors with rate of mortality.....                     | 36    |
| 34. Comparison of change in rates of mortality among males and females..... | 32    | 44. Diagram of survivors under 1 year.....                                           | 36    |
| 35. Urban and rural rates of mortality.....                                 | 33    | 45. Diagram showing deviation from the mean.....                                     | 36    |
| 36. Significant irregularities in rates of mortality.....                   | 33    | 46. Variations in form of curve of survivors.....                                    | 37    |
| 37. Mortality lower among women than among men.....                         | 33    |                                                                                      |       |

**PART I.—NONTECHNICAL DESCRIPTION AND EXPLANATION OF LIFE TABLE FUNCTIONS, GRAPHS, AND OTHER PARTS OF TEXT AND TABLES—Continued.**

**QUESTIONS AND ANSWERS ILLUSTRATING USE OF TABLES AND GRAPHS—Continued.**

| Section. | NUMBER OF DEATHS.                                                                         | Page. | Section. | DEATH RATE PER THOUSAND—continued.                                                                        | Page. |
|----------|-------------------------------------------------------------------------------------------|-------|----------|-----------------------------------------------------------------------------------------------------------|-------|
| 47.      | Incidence of deaths in a generation of 100,000 born alive..                               | 37    | 66.      | Average death rate for sections of the stationary population.                                             | 43    |
| 48.      | Variation of number of deaths with number of survivors and rate of mortality .....        | 37    | 67.      | Variation of average death rate with expectation of life...                                               | 43    |
|          | <b>COMPLETE EXPECTATION OF LIFE.</b>                                                      |       | 68.      | Change in average death rate with age.....                                                                | 43    |
| 49.      | Complete expectation of life at birth.....                                                | 37    |          | <b>LIFE TABLES OF FOREIGN COUNTRIES.</b>                                                                  |       |
| 50.      | Maximum expectation of life .....                                                         | 38    | 69.      | Countries, periods, graphs, and functions shown.....                                                      | 44    |
| 51.      | Variation of expectation of life.....                                                     | 38    | 70.      | Rate of mortality in foreign countries.....                                                               | 44    |
| 52.      | Change in expectation of life between 1901 and 1910.....                                  | 38    | 71.      | Number of survivors out of 100,000 born alive.....                                                        | 44    |
| 53.      | Comparison of expectation of life in different classes.....                               | 39    | 72.      | Number of deaths out of 100,000 born alive.....                                                           | 44    |
|          | <b>STATIONARY POPULATION.</b>                                                             |       | 73.      | Expectation of life in foreign countries.....                                                             | 45    |
| 54.      | Its production and the general conditions existing in it....                              | 39    | 74.      | Measure of vitality in foreign countries.....                                                             | 45    |
| 55.      | Age distribution of stationary population.....                                            | 40    |          | <b>MORTALITY TABLES OF INSURANCE COMPANIES.</b>                                                           |       |
| 56.      | Expectation of life at any age and population in current and all older age intervals..... | 40    | 75.      | Tables shown and where they are used.....                                                                 | 45    |
| 57.      | Total white population and total Negro population compared.....                           | 40    | 76.      | Distinction between insurance and census tables.....                                                      | 46    |
|          | <b>MEASURE OF VITALITY.</b>                                                               |       | 77.      | Graphs of insurance mortality tables.....                                                                 | 46    |
| 58.      | Meaning of measure of vitality.....                                                       | 40    | 78.      | Rates of mortality among insured lives.....                                                               | 46    |
| 59.      | Relation between measure of vitality and rate of mortality..                              | 41    | 79.      | Number of survivors among insured lives.....                                                              | 46    |
| 60.      | Maximum values and irregularities .....                                                   | 41    | 80.      | Number dying among insured lives.....                                                                     | 47    |

| Graph.                                                                 | Page. | Graph.                                                               | Page. |
| Both sexes: 1910:                                                      |       | Australia: 1901-1910. Italy: 1901-1910.                              |       |
| 1. Annual rate of mortality per thousand, $1000q_x$ .....              | 243   | England: 1901-1910. Sweden: 1901-1910.                               |       |
| Males and females: 1901 and 1910:                                      |       | Germany: 1901-1910. United States: 1901-1910.                        |       |
| 2. Annual and monthly rates of mortality per thousand, $1000q_x$ ..... | 244   | India: 1901-1910. (Whites in original registration states.)          |       |
| 12. Number of survivors out of 100,000 born alive, $l_x$ .....         | 254   | Males: 1901-1910:                                                    |       |
| 22. Number of deaths out of 100,000 born alive, $d_x$ .....            | 264   | 8. Annual rate of mortality per thousand, $1000q_x$ .....            | 250   |
| 32. Complete expectation of life, $e_x$ .....                          | 274   | 18. Number of survivors out of 100,000 born alive, $l_x$ .....       | 260   |
| 42. Measure of vitality, $\lambda_x$ .....                             | 284   | 28. Number of deaths out of 100,000 born alive, $d_x$ .....          | 270   |
| Negro males and females: 1901 and 1910:                                |       | 38. Complete expectation of life, $e_x$ .....                        | 280   |
| 3. Annual and monthly rates of mortality per thousand, $1000q_x$ ..... | 245   | 48. Measure of vitality, $\lambda_x$ .....                           | 290   |
| 13. Number of survivors out of 100,000 born alive, $l_x$ .....         | 255   | Females: 1901-1910:                                                  |       |
| 23. Number of deaths out of 100,000 born alive, $d_x$ .....            | 265   | 9. Annual rate of mortality per thousand, $1000q_x$ .....            | 251   |
| 33. Complete expectation of life, $e_x$ .....                          | 275   | 19. Number of survivors out of 100,000 born alive, $l_x$ .....       | 261   |
| 43. Measure of vitality, $\lambda_x$ .....                             | 285   | 29. Number of deaths out of 100,000 born alive, $d_x$ .....          | 271   |
| White males and females in cities: 1901 and 1910:                      |       | 39. Complete expectation of life, $e_x$ .....                        | 281   |
| 4. Annual and monthly rates of mortality per thousand, $1000q_x$ ..... | 246   | 49. Measure of vitality, $\lambda_x$ .....                           | 291   |
| 14. Number of survivors out of 100,000 born alive, $l_x$ .....         | 256   | MASSACHUSETTS.                                                       |       |
| 24. Number of deaths out of 100,000 born alive, $d_x$ .....            | 266   | Males and females: 1890, 1901, and 1910:                             |       |
| 34. Complete expectation of life, $e_x$ .....                          | 276   | 10. Annual rate of mortality per thousand, $1000q_x$ .....           | 252   |
| 44. Measure of vitality, $\lambda_x$ .....                             | 286   | 20. Number of survivors out of 100,000 born alive, $l_x$ .....       | 262   |
| White males and females in rural part: 1901 and 1910:                  |       | 30. Number of deaths out of 100,000 born alive, $d_x$ .....          | 272   |
| 5. Annual and monthly rates of mortality per thousand, $1000q_x$ ..... | 247   | 40. Complete expectation of life, $e_x$ .....                        | 282   |
| 15. Number of survivors out of 100,000 born alive, $l_x$ .....         | 257   | 50. Measure of vitality, $\lambda_x$ .....                           | 292   |
| 25. Number of deaths out of 100,000 born alive, $d_x$ .....            | 267   | LIFE INSURANCE MORTALITY TABLES.                                     |       |
| 35. Complete expectation of life, $e_x$ .....                          | 277   | American Experience Mortality Table: 1860.                           |       |
| 45. Measure of vitality, $\lambda_x$ .....                             | 287   | American-Canadian Mortality Investigation: 1900-1915.                |       |
| White and Negro males and females: 1910:                               |       | American Men. AM <sup>(5)</sup> .                                    |       |
| 6. Annual and monthly rates of mortality per thousand, $1000q_x$ ..... | 248   | British Offices Life Tables: 1863-1893. Males. OM <sup>(5)</sup> .   |       |
| 16. Number of survivors out of 100,000 born alive, $l_x$ .....         | 258   | Three Japanese Offices Life Tables: 1905. Males. JM <sup>(5)</sup> . |       |
| 26. Number of deaths out of 100,000 born alive, $d_x$ .....            | 268   | National Fraternal Congress Mortality Table: 1898.                   |       |
| 36. Complete expectation of life, $e_x$ .....                          | 278   | United States. Original registration states: 1909-1911.              |       |
| 46. Measure of vitality, $\lambda_x$ .....                             | 288   | White males.                                                         |       |
| White males and females in cities and rural part: 1910:                |       | 11. Annual rate of mortality per thousand, $1000q_x$ .....           | 253   |
| 7. Annual and monthly rates of mortality per thousand, $1000q_x$ ..... | 249   | 21. Number of survivors out of 79,116 alive at age 20, $l_x$ .....   | 263   |
| 17. Number of survivors out of 100,000 born alive, $l_x$ .....         | 259   | 31. Number of deaths out of 79,116 alive at age 20, $d_x$ .....      | 273   |
| 27. Number of deaths out of 100,000 born alive, $d_x$ .....            | 269   | 41. Complete expectation of life, $e_x$ .....                        | 283   |
| 37. Complete expectation of life, $e_x$ .....                          | 279   | 51. Measure of vitality, $\lambda_x$ .....                           | 293   |
| 47. Measure of vitality, $\lambda_x$ .....                             | 289   |                                                                      |       |

## PART V.—TABLES OF LIFE ANNUITIES, ANNUAL PREMIUMS, SINGLE PREMIUMS, AND COMMUTATION COLUMNS BASED ON LIFE TABLES FOR WHITE MALES AND FOR WHITE FEMALES IN THE ORIGINAL REGISTRATION STATES: 1910.

| Section.                                                                                      | Page. | ORIGINAL REGISTRATION STATES—continued                                           |       |
|-----------------------------------------------------------------------------------------------|-------|----------------------------------------------------------------------------------|-------|
| 93. Practical uses served by these tables.....                                                | 297   | Table.                                                                           | Page. |
| 94. Life annuities, net premiums, and commutation columns at different rates of interest..... | 297   | White females: 1910:                                                             |       |
| ORIGINAL REGISTRATION STATES.                                                                 |       | 99. Life annuity due, $a_x$ , at 3, $3\frac{1}{2}$ , 4, 5, and 6 per cent.....   | 312   |
| Table.                                                                                        |       | 100. Single net premiums, $1000A_x$ , at 3, $3\frac{1}{2}$ , and 4 per cent..... | 314   |
| White males: 1910:                                                                            |       | Annual net premiums, $1000P_x$ , at 3, $3\frac{1}{2}$ , and 4 per cent.....      | 314   |
| 92. Life annuity due, $a_x$ , at 3, $3\frac{1}{2}$ , 4, 5, and 6 per cent.                    | 298   | Commutation columns, $D_x$ , $N_x$ , $S_x$ , $C_x$ , $M_x$ , and $R_x$ :         |       |
| 93. Single net premiums, $1000A_x$ , at 3, $3\frac{1}{2}$ , and 4 per cent.....               | 300   | 101. 3 per cent.....                                                             | 316   |
| Annual net premiums, $1000P_x$ , at 3, $3\frac{1}{2}$ , and 4 per cent.....                   | 300   | 102. $3\frac{1}{2}$ per cent.....                                                | 318   |
| Commutation columns, $D_x$ , $N_x$ , $S_x$ , $C_x$ , $M_x$ , and $R_x$ :                      |       | 103. 4 per cent.....                                                             | 320   |
| 94. 3 per cent.....                                                                           | 302   | 104. 5 per cent.....                                                             | 322   |
| 95. $3\frac{1}{2}$ per cent.....                                                              | 304   | 105. 6 per cent.....                                                             | 324   |
| 96. 4 per cent.....                                                                           | 306   |                                                                                  |       |
| 97. 5 per cent.....                                                                           | 308   |                                                                                  |       |
| 98. 6 per cent.....                                                                           | 310   |                                                                                  |       |

## PART VI.—MATHEMATICAL THEORY OF CONSTRUCTION OF LIFE TABLES.

| Section.                                                                                                                                       | Page. |
|------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 95. Division into three main sections for construction.....                                                                                    | 329   |
| 96. Graphical representation of flow of population .....                                                                                       | 329   |
| 97. Mathematical theory of flow of population.....                                                                                             | 330   |
| 98. Two important theorems.....                                                                                                                | 331   |
| 99. Aggregate of those surviving to same age .....                                                                                             | 332   |
| 100. Aggregate of those living at same time.....                                                                                               | 333   |
| 101. First aggregate of the dead: type one.....                                                                                                | 333   |
| 102. Second aggregate of the dead: type two.....                                                                                               | 334   |
| 103. Third aggregate of the dead: type three.....                                                                                              | 334   |
| 104. Relations between aggregates of the living and of the dead.                                                                               | 335   |
| 105. Expression of rate of mortality in terms of statistical aggregates .....                                                                  | 336   |
| 106. Calculation of number of births.....                                                                                                      | 338   |
| 107. Percentage of decedents born in earlier and later calendar years derived from German mortality statistics.....                            | 339   |
| 108. Method employed to verify these percentages.....                                                                                          | 339   |
| 109. Percentages adopted and calculation of number of births from population and death statistics.....                                         | 340   |
| 110. Populations under 2 years not employed to calculate number of births.....                                                                 | 342   |
| 111. Calculation of rates of mortality for single years under 5 years of age.....                                                              | 342   |
| 112. Calculation of monthly rates of mortality under 1 year...                                                                                 | 343   |
| 113. Derivation of the osculatory fifth difference formula.....                                                                                | 344   |
| 114. Leading fractional differences in terms of leading integral differences .....                                                             | 345   |
| 115. Determination of the fifth difference correction.....                                                                                     | 346   |
| 116. Fourth difference interpolation curves employed at beginning and end of fifth difference osculatory interpolation.                        | 347   |
| 117. Wittstein's formula modified for the rates of mortality at advanced ages.....                                                             | 348   |
| 118. Old age rates employed to determine constants.....                                                                                        | 349   |
| 119. Determination of constants in Wittstein's formula.....                                                                                    | 349   |
| 120. The overlapping series of rates of mortality .....                                                                                        | 350   |
| 121. Spencer's 21-term formula.....                                                                                                            | 350   |
| 122. Summary of methods employed to obtain the rates of mortality.....                                                                         | 350   |
| 123. Calculation of the derived mortality functions.....                                                                                       | 350   |
| 124. Calculation of the derived mortality functions under 5 years.....                                                                         | 351   |
| 125. Special formulas and processes.....                                                                                                       | 352   |
| 126. Junction of rates of mortality under age 5 with rates by osculatory interpolation.....                                                    | 352   |
| 127. Determination of mean population .....                                                                                                    | 353   |
| 128. Rates of mortality calculated for life tables tested for smoothness and conformity to original statistics.....                            | 354   |
| 129. Variation of rates of mortality with quinquennial age groups of statistics to which the osculatory interpolation formula is applied ..... | 356   |
| 130. Ratio test for concentration in age groups.....                                                                                           | 362   |
| 131. Selection of quinquennial age group for osculatory interpolation in construction of United States life tables....                         | 364   |
| 132. Graphs for age interval under 1 year and age interval under 1 month.....                                                                  | 364   |

## TABLES.

| Table.                                                                                                                                                                                              | Page. |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 106. Number of reported deaths among males in the state of New York used in computing the number of births....                                                                                      | 338   |
| 107. Graduated percentages of deaths in calendar year according to later and earlier calendar years of birth for first ten yearly age intervals, based on deaths in Prussia in years 1901-1905..... | 339   |
| 108. Percentage of decedents who were born in later calendar year.....                                                                                                                              | 339   |

## TABLES—continued.

| Table.                                                                                                                                                                                          | Page. |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 109. Percentages of deaths in calendar year according to later and earlier years of birth for first five yearly age intervals, employed in computing births for United States life tables ..... | 340   |
| 110. Number of male births in the state of New York in 1909, 1910, and 1911, derived from population and mortality statistics.....                                                              | 342   |
| 111. Computation of rate of mortality by single years of age under 5 for males in the state of New York, 1909-1911..                                                                            | 343   |
| 112. Computation of rate of mortality by months of age under 1 year for males in the state of New York, 1909-1911..                                                                             | 343   |
| 113. Derivation of leading fractional differences in terms of leading integral differences.....                                                                                                 | 346   |
| 114. Derivation of coefficients for corrected fifth differences in the osculatory interpolation formula.....                                                                                    | 347   |
| 115. Fifth differences of the osculatory interpolation formula from $n+2.0$ to $n+3.0$ in terms of $.0016\Delta^3y_n$ and $.0016\Delta^3y_{n+1}$ .....                                          | 347   |
| 116. Junction of fourth difference interpolation curves with fifth difference osculatory interpolation curves at beginning and end of range of interpolation.....                               | 348   |
| 117. Determination of percentage of deaths under 1 month to be added to those surviving to age 1 month to obtain population under 1 month .....                                                 | 351   |
| 118. First outline used in calculation of rates of mortality joining those under age 5 with those by osculatory interpolation.....                                                              | 352   |
| 119. Second outline used in calculation of rates of mortality joining those under age 5 with those by osculatory interpolation.....                                                             | 353   |
| 120. Third differences of rates of mortality, taken to five decimals, among whites in the original registration states, 1910. $10^5\delta^3q_x$ .....                                           | 355   |
| 121. Deviations of expected deaths from actual deaths among whites in the original registration states, 1910.....                                                                               | 356   |
| 122. Various rates of mortality obtained from same original statistics.....                                                                                                                     | 357   |
| 123. Deviations of rates of mortality for each group from those for the average group in Table 122, multiplied by $10^6$ .....                                                                  | 358   |
| 124. Third differences of graduated rates of mortality in Table 122. $10^5\delta^3q_x$ .....                                                                                                    | 359   |
| 125. Deviation of expected deaths, according to graduated rates of mortality in Table 122, from actual deaths....                                                                               | 360   |
| 126. Weighted squared deviations of graduated rates of mortality from observed rates of mortality in Table 122....                                                                              | 361   |
| 127. Quinquennial age groups tested by comparing ratios of population .....                                                                                                                     | 362   |
| 128. Quinquennial age groups tested by comparing difference of averaged ratios for populations and for deaths.....                                                                              | 363   |
| 129. Additional mortality statistics used in drawing graphs...                                                                                                                                  | 364   |

## DIAGRAMS.

| Diagram.                                                                                            | Page. |
|-----------------------------------------------------------------------------------------------------|-------|
| 1. Connection between flow of a population and time and age.                                        | 329   |
| 2. Flow of a population measured by life lines.....                                                 | 330   |
| 3. Variation of rates with time and with age.....                                                   | 331   |
| 4. Variation in number of survivors with time and with age..                                        | 331   |
| 5. Number of deaths in closed area.....                                                             | 332   |
| 6. Birth and time intervals covered by those surviving to same age.....                             | 332   |
| 7. Birth and age intervals covered by those living at same time.....                                | 333   |
| 8. Aggregate of the dead who were born in same time interval and who died in same age interval..... | 333   |

## PART VI.—MATHEMATICAL THEORY OF CONSTRUCTION OF LIFE TABLES—Continued.

| DIAGRAMS—continued.                                                                                    |       | DIAGRAMS—continued.                                                                                                                       |       |
|--------------------------------------------------------------------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------|-------|
| Diagram.                                                                                               | Page. | Diagram.                                                                                                                                  | Page. |
| 9. Aggregate of the dead who were born in same time interval and who died in same time interval.....   | 334   | 14. Relation between rate of mortality and aggregates of the living and of the dead.....                                                  | 337   |
| 10. Aggregate of the dead who died in same time interval and in same age interval.....                 | 335   | 15. Graphic representation of number of deaths given in Table 106.....                                                                    | 338   |
| 11. Integration to determine number of dead in type three aggregate.....                               | 335   | 16. Division of elementary parallelogram into months of age..                                                                             | 339   |
| 12. Relations between aggregates of the living and of the dead.....                                    | 336   | 17. Application of factors in Table 109 to deaths in Diagram 15; also insertion of corresponding populations from tape 139, page 373..... | 341   |
| 13. Variation of aggregates of the living and type three aggregates of the dead with age and time..... | 336   | 18. Illustrating proof of formula for osculatory interpolation..                                                                          | 345   |

## PART VII.—DESCRIPTION OF CALCULATION OF LIFE TABLE FOR MALES IN THE STATE OF NEW YORK, 1910, INCLUDING PHOTOGRAPHS OF GRAPHS, DIAGRAMS, AND ADDING MACHINE TAPES USED IN CONNECTION WITH NUMERICAL COMPUTATIONS. ALSO TABULAR OUTLINE FOR CONSTRUCTION OF EACH LIFE TABLE.

| Section.                                                                                                                                                                        | Page. | Section.                                                                                                                                                                                | Page. |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| 133. Descriptive text and photographed tapes.....                                                                                                                               | 369   | 229-249. Calculation of life table functions.....                                                                                                                                       | 404   |
| 134. Special methods used in construction of some life tables.....                                                                                                              | 369   | 250-263. Calculation of rates of mortality joining those under age 5 with those by osculatory interpolation, for white females in cities of the original registration states, 1901..... | 408   |
| 135. Extra information needed for construction of each life table.....                                                                                                          | 369   | 264-274. Calculation of mean population of white females in the original registration states for the period 1901-1910.....                                                              | 410   |
| 136. Adjustment for deaths by months under 1 year of age.                                                                                                                       | 370   |                                                                                                                                                                                         |       |

| 174-187. Rates of mortality at older ages determined from populations and deaths graduated from the original statistics grouped in all five quinquennial age groups..           | 388   |                                                                                                                                                                                         |       |
| 188-205. Rates of mortality at older ages determined by application of Wittstein's formula to the averaged rates from all five quinquennial groups.....                         | 392   |                                                                                                                                                                                         |       |
| 206-228. Rates of mortality at older ages smoothed by Spencer's 21-term formula.....                                                                                            | 398   |                                                                                                                                                                                         |       |

## TABLES.

| Table.                                                                                                                    |     |
|---------------------------------------------------------------------------------------------------------------------------|-----|
| 130. Products of $16\Delta^5 T_x$ for $x$ equals 4-10, 9-10, 4, 9, 14, and 19 by the factors +1, +3, +5, and -6.....      | 380 |
| 131. Unit fifth differences of $T_x$ from ages 9 to 14 in terms of $16\Delta^5 T_{9-10}$ and $16\Delta^5 T_{0-5=4}$ ..... | 382 |
| 132. Unit fifth differences of $T_x$ from ages 14 to 19 in terms of $16\Delta^5 T_4$ and $16\Delta^5 T_0$ .....           | 382 |
| 133. Unit fifth differences of $T_x$ from ages 20 to 29 in terms of $16\Delta^5 T_y$ for $y$ equals 9, 14, and 19.....    | 382 |
| 134. Derivation of the operand in Spencer's 21-term formula for ages 73 to 76.....                                        | 398 |
| 135. Tabular outline for construction of each life table.....                                                             | 416 |

## GRAPHS, TAPES, DIAGRAMS, AND OPERATIONS USED IN CALCULATIONS.

| Infant mortality and annual rates of mortality under 5 years from birth and death statistics.                                                                                              |       | Infant mortality and annual rates of mortality under 5 years from birth and death statistics—Continued.                                 |                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Graph.                                                                                                                                                                                     | Page. | Tape.                                                                                                                                   | Page.                                                                                                                                     |
| 136. $D_x^{(2)}$ . Number of deaths by months under 1 year adjusted graphically.....                                                                                                       | 371   | 142. $E_0$ . Additions of deaths and populations in diagram 141 to obtain number of births.....                                         | 373                                                                                                                                       |
| 137. $P_x$ . Populations July 1, 1900 and 1910, by years under age 5.....                                                                                                                  | 373   | 143. $\delta_x$ and $\frac{1}{2}\delta_x$ . Increase in population according to tape 139; check on work.....                            | 373                                                                                                                                       |
| 138. $\log_y P_0$ . $y$ is December 31 in each year from 1908 to 1913; check on work.....                                                                                                  | 373   | 144. $\frac{1}{2}(\delta_x^{(2)} + \delta_{x+1}^{(2)})$ . Average monthly increase in population, or $\frac{1}{12}$ of $\delta_0$ ..... | 373                                                                                                                                       |
| 139. $P_x$ . Populations used in determining number of births and exposed to risk of death by months under 1 year and by years under age 5, from antilogarithms indicated in tape 138..... | 373   |                                                                                                                                         |                                                                                                                                           |
| Diagram.                                                                                                                                                                                   |       | 145. $E_x^{(12)} - \frac{1}{2}\delta_x^{(12)}$ and $D_x^{(12)}$ ,<br>$E_x - \frac{1}{2}\delta_x$ and $D_x$ .                            | Numbers exposed to risk of death and corresponding numbers of deaths by months under 1 year and by years under age 5; check on work.. 373 |
| 140. Number of deaths arranged graphically as first step in determining number of births.....                                                                                              | 373   |                                                                                                                                         |                                                                                                                                           |
| 141. Number of deaths, divided according to year of birth, and populations from tape 139 arranged graphically as second step in determining number of births.....                          | 373   | 146. $q_x^{(12)}$ , $p_x^{(12)}$ , and $q_x$ , $p_x$ .                                                                                  | Rate of mortality and probability of living by months under 1 year and by years under age 5..... 373                                      |

**PART VII.—DESCRIPTION OF CALCULATION OF LIFE TABLE FOR MALES IN THE STATE OF NEW YORK, 1910, INCLUDING PHOTOGRAPHS OF GRAPHS, DIAGRAMS, AND ADDING MACHINE TAPES USED IN CONNECTION WITH NUMERICAL COMPUTATIONS. ALSO TABULAR OUTLINE FOR CONSTRUCTION OF EACH LIFE TABLE—Continued.**

**GRAPHS, TAPES, DIAGRAMS, AND OPERATIONS USED IN CALCULATIONS—Continued.**

| Rates of mortality from statistics graduated by osculatory interpolation.                                                                                                                                 |       | Averaged rates of mortality from statistics grouped in all five quinquennial age groups—Continued.                                                                                      |       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| Tape.                                                                                                                                                                                                     | Page. | Tape.                                                                                                                                                                                   | Page. |
| 147. Addition of $P_x$ and $(3d)_x$ to obtain first quinquennial differences of $T_x$ and $(3l)_x$ .....                                                                                                  | 373   | 175. $-2\Delta T_x$ and $-2\Delta(3l)_x$ . Twice the first quinquennial differences of $T_x$ and $(3l)_x$ from tape 174, arranged so that ages five years apart follow one another..... | 389   |
| 148. $\Delta T_x$ and $\Delta(3l)_x$ . $x=4, 9$ , and so on to 109, copied from tape 147; check on work.....                                                                                              | 373   | 176. $-\Delta T_x$ and $-\Delta(3l)_x$ . Additions of subtotals in tape 174 used in checking tape 175 and in obtaining tape 183.....                                                    | 391   |
| 149. $\Delta^2 T_x$ and $\Delta^2(3l)_x$ {                                                                                                                                                                | 373   | 177. $2\Delta^2 T_x$ and $2\Delta^2(3l)_x$ . Second quinquennial differences of $2T_x$ and $2(3l)_x$ derived from tape 175; checks on work.....                                         | 391   |
| 150. $\Delta^3 T_x$ and $\Delta^3(3l)_x$ {                                                                                                                                                                |       | 178. $-2\Delta^3 T_x$ and $-2\Delta^3(3l)_x$ . Third quinquennial differences of $-2T_x$ and $-2(3l)_x$ derived from tape 177; checks on work.....                                      | 391   |
| 151. $\Delta^4 T_x$ and $\Delta^4(3l)_x$ {                                                                                                                                                                | 377   | 179. $-8\Delta^3 T_x$ and $-8\Delta^3(3l)_x$ . Four times numbers in tape 178; check on work.....                                                                                       | 391   |
| 152. $\Delta^5 T_x$ and $\Delta^5(3l)_x$ {                                                                                                                                                                |       | 180. $L_x$ and $(3d)_x$ . One hundred times values in tape 175 less those in tape 179.....                                                                                              | 391   |
| 153. $16\Delta^5 T_x$ and $16\Delta^5(3l)_x$ . Products of 16 times fifth quinquennial differences of $T_x$ and $(3l)_x$ from tape 152; check on work.....                                                | 377   | 181. $3L_x + \frac{1}{2}(3d)_x$ . Additions to obtain number exposed to risk.....                                                                                                       | 391   |
| 154. $\delta^4 T_x$ , $\delta^3 T_x$ , $\delta^2 T_x$ , and $\delta T_x$ {                                                                                                                                | 377   | 182. $(3l)_x$ and $(3d)_x$ . From tape 181 and from tape 180, respectively.....                                                                                                         | 391   |
| 155. $\delta^4 T_{99}$ , $\delta^3 T_{99}$ , $\delta^2 T_{99}$ , and $\delta T_{99}$ {                                                                                                                    |       | 183. Check on work in tapes 180 to 182.....                                                                                                                                             | 393   |
| Diagram.                                                                                                                                                                                                  |       | 184. $\sum_{x=4}^{x+4} q_x$ . Rates of mortality summed in all possible age groups of five.....                                                                                         | 393   |
| 156. Outline for deriving fourth unit differences of $T_x$ from multiples of $16\Delta^5 T_x$ .....                                                                                                       | 377   | 185. $\sum_{x=103}^{x=107} q_x$ . Check on summations in tape 184.....                                                                                                                  | 393   |
| Tape.                                                                                                                                                                                                     |       | 186. Averaged $q_x$ . One-fifth of subtotals in tape 184.....                                                                                                                           | 393   |
| 157. Multiples of $16\Delta^5 T_x$ by +1, +3, +5, and -6.....                                                                                                                                             | 377   | 187. Check on work in tape 186.....                                                                                                                                                     | 393   |

Summation of values for ages 94 to 98, or ages 99 to 103.....                                                                                                   | 397   |
| 167. $\delta^2(3l)_x$ {                                                                                                                                                                                   | 387   | 199. $-\log \log a_x$ . Average of values of $-\log \log a_x$ in tape 198; check on work.....                                                                                           | 397   |
| 168. $\delta(3l)_x$ {                                                                                                                                                                                     |       | 200. $\log \log a_x$ . Negative value indicated by writing complement.....                                                                                                              | 397   |
| 169. $3L_x + \frac{1}{2}(3d)_x$ . Additions to obtain number exposed to risk at each year of age.....                                                                                                     | 389   |                                                                                                                                                                                         |       |
| 170. $(3l)_x$ . Sums in tape 169 copied in groups of five.....                                                                                                                                            | 389   |                                                                                                                                                                                         |       |
| 171. $3\Delta T_x + \frac{1}{2}\Delta(3l)_x$ . Check on work in tapes 169 and 170.....                                                                                                                    | 389   |                                                                                                                                                                                         |       |
| 172. $(3d)_x$ . Number of deaths from tape 168 copied in groups of five; sums checked with $\Delta(3l)_x$ in tape 148.....                                                                                | 389   |                                                                                                                                                                                         |       |
| 173. $q_x$ and $p_x$ . Rate of mortality and probability of living for each year of age from 4 to 109.....                                                                                                | 389   |                                                                                                                                                                                         |       |
| <b>Averaged rates of mortality from statistics grouped in all five quinquennial age groups.</b>                                                                                                           |       |                                                                                                                                                                                         |       |
| 174. $\sum_x^{x+4} P_x$ and $\sum_x^{x+4} (3d)_x$ . Addition of $P_x$ and $(3d)_x$ to obtain first quinquennial differences of $T_x$ and $(3l)_x$ for each year of age from 80 to 110; check on work..... | 389   |                                                                                                                                                                                         |       |

PART VII.—DESCRIPTION OF CALCULATION OF LIFE TABLE FOR MALES IN THE STATE OF NEW YORK, 1910, INCLUDING PHOTOGRAPHS OF GRAPHS, DIAGRAMS, AND ADDING MACHINE TAPES USED IN CONNECTION WITH NUMERICAL COMPUTATIONS. ALSO TABULAR OUTLINE FOR CONSTRUCTION OF EACH LIFE TABLE—Continued.

GRAPHS, TAPES, DIAGRAMS, AND OPERATIONS USED IN CALCULATIONS—Continued.

| Rates of mortality by application of Wittstein's formula to averaged rates of mortality from statistics grouped in all five quinquennial age groups—Continued. |       | Derivation of life table functions from rates of mortality selected according to columns 17 to 22 in Table 135.                                                   |       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| Tape.                                                                                                                                                          | Page. | Tape.                                                                                                                                                             | Page. |
| 201. $\bar{n}$ . Average of values of $n_x$ in tape 196; check on work...                                                                                      | 397   | 229. $L_x^{(2)}$ . Additions of number of survivors by months under one year as step in determining number in stationary population by months under one year..... | 405   |
| 202. $\log(-\log q_x) = \bar{n} \log(115-x) + \log \log a$ . See tapes 201, 194, and 200.....                                                                  | 397   | 230. $l_x, x=1$ to 5 years. Check on work in tapes 231 and 235..                                                                                                  | 405   |
| 203. Check on work in tape 202.....                                                                                                                            | 397   | 231. $L_x$ . Additions of survivors in tape 230 to obtain number in population by single years under age 5.                                                       | 405   |
| 204. $\log q_x$ . Complements of antilogarithms of totals in tape 202.....                                                                                     | 397   | 232. $l_x, x=5$ to 112 years. Additions of survivors for determining numbers in population.....                                                                   | 405   |
| 205. $q_x$ and $p_x$ $x=94$ to 115                                                                                                                             | 397   | 233. $L_x^{(2)}$ . Population by months under one year; check on work.....                                                                                        | 405   |
|                                                                                                                                                                |       | 234. Check on quotients in tape 233.....                                                                                                                          | 405   |
| Rates of mortality smoothed by Spencer's 21-term formula.                                                                                                      |       | 235. $L_x, x=1$ to 4 years. Populations copied from tape 231 to obtain check on work.....                                                                         | 405   |
| 206. Rates of mortality to be smoothed by Spencer's 21-term formula.....                                                                                       | 397   | 236. $L_x, x=5$ years and over. Populations obtained by taking one-half the sums of the tapes in 232....                                                          | 405   |
| 207. $u_x$ . Rates of mortality in tape 206 divided by 7.....                                                                                                  | 399   | Section.                                                                                                                                                          |       |
| 208. Check on $u_x$ in tape 207.....                                                                                                                           | 399   | *237. $L_x$ . Copied in column 2 of Table 56 from tapes 229, 230, and 232.....                                                                                    | 406   |
| 209. $U_x = -u_{x-3} + u_{x-1} + 2u_x + u_{x+1} - u_{x+3}$ . Addition to obtain operand of Spencer's 21-term formula....                                       | 399   | *238. $d_x$ . Differencing $l_x$ of column 2 in Table 56 to obtain column 3.....                                                                                  | 406   |
| 210. $U_x$ . Values of operand copied from tape 209 in groups of five.....                                                                                     | 399   | *239. $L_x$ . Copied in column 6 of Table 56 from tapes 233, 235, and 236.....                                                                                    | 406   |
| 211. Check on work in tapes 209 and 210.....                                                                                                                   | 399   | Tape.                                                                                                                                                             |       |
| 212. $v_x = \sum_{x-3}^{x+3} U_x$ . Summation of operand in tape 210 in all possible groups of seven.....                                                      | 399   | 240. $d_x$ . Check on $d_x$ shown in column 3 of Table 56.....                                                                                                    | 407   |
| 213. Check on additions in tape 212.....                                                                                                                       | 399   | 241. $T_x$ . Additions to obtain population in current and all older age intervals.....                                                                           | 407   |
| 214. $v_x$ . Additions of sums obtained in tape 212 in groups of five.....                                                                                     | 403   | 242. $d_x$ . To four places of decimals, aged 80 years and over; obtained by differencing $l_x$ from tape 232..                                                   | 407   |
| 215. Check on work in tapes 212 and 214.....                                                                                                                   | 403   | 243. $T_x$ . To four places of decimals, aged 80 years and over, obtained by adding $L_x$ in tape 236.....                                                        | 407   |
| 216. $w_x = v_x + 5$ . Values in tape 214 divided by 5.....                                                                                                    | 403   | Section.                                                                                                                                                          |       |
| 217. Check on quotients obtained in tape 216.....                                                                                                              | 403   | *244. $T_x$ . Copying of sums in tape 241 into column 8 of Table 56.                                                                                              | 406   |
| 218. $V_x = \sum_{x-2}^{x+2} w_x$ . Summation of values in tape 216 in all possible groups of five.....                                                        | 403   | *245. $\lambda_x = L_x/d_x$ . Measure of vitality obtained and entered in column 7 of Table 56.....                                                               | 406   |
| 219. Check on additions in tape 218.....                                                                                                                       | 403   | *246. $e_x = T_x/l_x$ . Expectation of life obtained and entered in column 5 of Table 56.....                                                                     | 406   |
| 220. $V_x$ . Additions of sums obtained in tapes 218 in groups of five.....                                                                                    | 403   | *247. $1000L_x/T_x$ . Death rate per thousand obtained and entered in column 9 of Table 56.....                                                                   | 406   |
| 221. Check on work in tapes 218 and 220.....                                                                                                                   | 403   | *248. $1000q_x$ . Copying of values from tapes 146, 173, 226, and 205 in column 4 of Table 56 according to the first paragraph in section 229.....                | 408   |
| 222. $10^3 q_x = \sum_{x-2}^{x+2} V_x$ . Summation of values in tape 220 in all possible groups of five.....                                                   | 403   | *249. Checking results of duplicate computations of the life table.....                                                                                           | 408   |
| 223. Check on additions in tape 222.....                                                                                                                       | 403   | Joining annual rates of mortality under five years with those by osculatory interpolation.                                                                        |       |
| 224. $10^3 q_x$ . Additions of sums obtained in tapes 222 in groups of five.....                                                                               | 403   | Tape.                                                                                                                                                             |       |
| 225. Check on work in tapes 222 and 224.....                                                                                                                   | 403   | 250. $x, u_x, v_x, q_x$ . Values in columns 1 to 4 in Table 118 on page 352.....                                                                                  | 409   |
| 226. $10^6 q_x$ and $10^6 p_x$ . Rates of mortality obtained from tape 224 and the corresponding probabilities of living.....                                  | 405   | 251. $2q_x$ and $2-q_x$ . Values in columns 5 and 6 in Table 118..                                                                                                | 409   |
| 227. Check on work in tape 226.....                                                                                                                            | 405   | 252. $u_x, v_x$ , and $m_x$ . Values of column 7 used in determining those of column 8 in Table 118.....                                                          | 409   |
| 228. $10^3 q_x, 10^3 q_x$ , and $10^3 q_x$ Rates of mortality from tapes 173, 226, and 205 with first and second differences of same.....                      | 405   | 253. $U$ and $U_x, e$ and $f$ . Values in column 8 of Table 118 used in determining values in column 9.....                                                       | 409   |

\* These operations are not represented by tapes, diagrams, or graphs.

GRAPHS, TAPES, DIAGRAMS, AND OPERATIONS USED IN CALCULATIONS—Continued

Mean population: 1901-1910.

| Tape.                                                                                                                                     | Page.                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## LETTER OF TRANSMITTAL.

---

DEPARTMENT OF COMMERCE,  
BUREAU OF THE CENSUS,  
*Washington, D. C., May 1, 1920.*

SIR:

I transmit herewith the United States Life Tables, 1890, 1901, 1910, and 1901-1910, prepared by James W. Glover, expert special agent of the Bureau of the Census and professor of mathematics and insurance in the University of Michigan.

These life tables exhibit the rates of mortality and expectations of life at each age among persons living in the United States and are the finished product derived from the statistics on births, deaths, and populations in the Bureau of the Census. They show that during the two decades from 1890 to 1910 mortality conditions have greatly improved among men and women under age 50, but that after this age they have remained about stationary. They also show wide variations in the rates of mortality in different classes of the population. For example, the rates of mortality and expectations of life are much more favorable for women than for men, for persons residing in the country than for persons residing in the cities, for whites than for Negroes, and, for most ages, for the native born than for the foreign born.

All the original statistics used in the construction of the United States Life Tables are given, and the mathematical theory of the construction of the life tables is explained and the numerical processes are described.

In addition to the United States Life Tables, a number of life tables showing mortality conditions in foreign countries are included. They may be used to compare the rates of mortality and expectations of life in the United States with those in Europe, Japan, India, and Australia. Important mortality tables, based on the experience of life insurance companies in the United States and foreign countries on insured lives, are also given.

This volume is intended to be of service primarily as a source of information to the public. It should be particularly useful to public health officials, students of vital statistics, physicians, sociologists, actuaries, statisticians, and others interested in the improvement of public health. Tables of life annuities and reversions are often required in connection with the settlement of estates, valuation of reversions, retirement funds, and old-age pensions. Such tables are included at various rates of interest based on the life tables for white males and for white females in the original registration states in 1910. These life tables undoubtedly reflect more closely than any others the rates of mortality existing at the present time among white men and white women in the general population of the United States.

The Bureau has had the advice and cooperation of a special census committee representing the Actuarial Society of America, composed of John K. Gore, chairman, Robert Henderson, Arthur Hunter, William A. Hutcheson, and Henry Moir. The tables have been prepared along lines approved by this committee.

Acknowledgment is made to Miss Elbertie Foudray, who had charge of the computations and rendered valuable aid in the preparation of the tables and text; to Mr. C. S. Sloane, the geographer of the Census, for the estimates of population and the drawing of the graphs; and to Dr. William H. Davis, chief statistician for vital statistics, for assistance rendered by his division, where the major portion of the work was done.

Respectfully,

SAM. L. ROGERS,  
*Director of the Census.*

Hon. JOSHUA W. ALEXANDER,  
*Secretary of Commerce.*

---

# UNITED STATES LIFE TABLES

1890, 1901, 1910, AND 1901-1910

---

# UNITED STATES LIFE TABLES: 1890, 1901, 1910, AND 1901-1910.

## INTRODUCTION.

### DIVISION OF TEXT WITH REFERENCE TO USE OF LIFE TABLES.

1. This volume is the second official publication issued by the Bureau of the Census on life tables prepared from the population and death statistics of the original registration states.<sup>1</sup> It is divided into eight parts, of which the first five are nontechnical and designed for the general reader. The remaining three parts are for students and actuaries who wish to know the formulas used in the construction of the life tables, the methods employed in the numerical calculations, and the original statistics from which the tables were derived. The average reader desires to learn how to consult the tables but does not care about the methods of construction. A careful reading of Part I of this text, pages 23 to 49, will enable him to extract all the information which ordinarily will be required. In particular, it will suffice to give him a working knowledge of how to obtain the rates of mortality, expectations of life, values of annuities, and other data from the tables, and to make intelligent use of the graphs.

### EXTENT OF LIFE TABLES.

2. It is believed that the population and mortality statistics upon which the values in these life tables are based warrant confidence in the results. In practically all the tables the large numbers involved, in both the population and death statistics, tend to insure reliable averages. The smallest population for which a life table was calculated included 40,725 lives, with 13,484 reported deaths, and the largest, 24,131,759 lives, with 1,098,678 reported deaths.

These tables exhibit at each age the number of lives surviving at the beginning of the age interval out of 100,000 born alive, the number dying in the age interval, the rate of mortality per thousand, and the complete expectation of life. For the stationary population there are four more columns based on the calculated mortality rates; they show the population in current age interval, the population per death in current age interval, the population in current and all older age intervals, and the average annual death rate per thousand of population in current and all older age intervals.

Most of the tables are for populations residing in the area referred to as the original registration states—

<sup>1</sup> So called because they were the states whose registration of deaths was accepted by the bureau in 1900 when it began to publish mortality reports for each calendar year.

Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, Michigan, and the District of Columbia. In addition to life tables for males and females in the original registration states, other tables are given for certain broad subdivisions of this population. These are white, Negro, native white, foreign-born white, white in cities, and white in rural districts. A second class of life tables is given for five of the large registration states, Indiana, Massachusetts, Michigan, New Jersey, and New York, and a third class is comprised of tables for the four cities, Boston, Chicago, New York, and Philadelphia. There are two tables including both sexes based on the total population of the original registration states; all other life tables are given separately for males and for females.

The United States Life Tables, 1910, published in 1916, included those for 1910 only, but the life tables in the present volume are for 1890, 1901, 1910, and 1901-1910. Most of the tables are based upon the populations of 1901 and 1910, and deaths for the three-year periods 1900-1902 and 1909-1911, respectively. Two life tables for males and females in the state of Massachusetts are the only ones based on the populations and deaths for the census year 1890. This range in the period covered by the life tables makes it possible to compare the changes in mortality rates and expectations of life which took place during two decades in Massachusetts, namely, 1890 to 1901 and 1901 to 1910, and during one decade, 1901 to 1910, in the other classes for which tables have been prepared. Several life tables covering a range of ten years have been prepared for certain important classes of the population. They are based on the reported deaths and the mean population for the entire ten-year period 1901 to 1910.

### INFANT MORTALITY TABLES.

3. In recent years much attention has been given to the lowering of infant mortality. Owing to the lack of reliable statistics on birth registration in most communities during the period for which these life tables were calculated, it was difficult to determine the rate of mortality during the first year of life. It changes very rapidly, decreasing from a monthly rate of 40 or 50 per thousand in the first month of life to 4 or 5 per thousand in the twelfth month of life. On account of the importance of this subject a separate

infant mortality table, appearing at the head of the life table, has been constructed where statistics were available, which shows the rate of mortality and other derived values in each column by age intervals of one month. An examination of the infant mortality tables reveals significant differences in mortality conditions in different classes of the general population in 1901 and in 1910, and also important changes which took place from 1901 to 1910. In most cases the calculations have been based upon the enumerated populations and reported deaths rather than on the birth registration statistics, as the numbers of reported births usually have been found too small.

#### POLICY ADOPTED IN CONSTRUCTION OF TABLES.

4. In constructing life tables it is necessary to make some adjustments of the original data. For example, it is well known that the enumerated populations and reported deaths are exaggerated at such ages as 25, 30, and 35, in other words, at multiples of 5. Also at advanced ages the numbers become so small that the calculated rates of mortality are quite irregular. While adjustments in such cases are necessary, all irregularities in the figures in these life tables have not been removed by smoothing processes. This policy was adopted in order to avoid the possible elimination of small but characteristic variations in mortality. In spite of this fact some of the tables, notably those derived from a large number of lives and reported deaths, proceed with remarkable smoothness and regularity throughout the entire range of life. On the other hand, the Negro tables and some others exhibit considerable roughness at some points. The general trend of the rate of mortality, however, is clearly apparent in every case.

#### PURPOSE OF LIFE TABLES.

5. The main purpose in presenting and explaining the tables is to make them useful to the general public. The facts set forth in figures and graphs concerning rates of mortality and expectations of life at every age for this and other countries are in themselves of interest to most persons. Copious table headings are employed and detailed explanations made to simplify the subject and to assist the reader. Too frequently questions relating to probabilities of life and death have been answered by a procession of dreary and forbidding columns of unexplained figures or in terms of unrecognizable technical symbols. It is important and highly desirable that this information be presented in such form as to attract the attention and hold the interest of the average reader.

In order to accomplish this end several pages in this volume are devoted to a detailed explanation of each of the nine columns appearing in most of the life tables. The headings of these columns, the symbols employed, and the portions of the table re-

lating to infant mortality and to general mortality are fully explained in nontechnical language. It is believed that a perusal of these pages will make it easy for the average reader to gain a great deal of useful information from the various life tables.

#### QUESTIONS AND ANSWERS.

6. While the explanation of the different columns is helpful, it is quite certain that the illustrative examples on the question and answer plan are of still more assistance. Each question stated in the text relates to some kind of information which can be obtained from the tables, and the answer is given by referring to the page upon which the particular life table appears and the column in which the desired item is found.

The section on questions and answers is divided into a number of parts corresponding somewhat to the different columns which appear in the life tables. There is one section which relates to questions and answers on the expectation of life, another on the rate of mortality per thousand, another on the stationary population, and so on. The reader is instructed not only in the use of the numbers in the life tables, but also in the use of the graphs or curves which appear in another part of this text. For certain kinds of information it is more satisfactory to refer to a graph or a combination of graphs than to columns of figures, and the questions and answers are designed to lead the reader to the discovery of this fact.

#### THE UNITED STATES LIFE TABLES.

7. Part II contains the seventy-four life tables based on populations and reported deaths in this country.

A few facts exhibited by these life tables are so important and striking as to deserve special mention. It is shown very clearly that, in general, mortality at practically all ages is higher among males than among females. In 1901 the expectation of life among white females at birth was about 2.85 years greater than that among white males, and in 1910 the excess in favor of the females had increased to 3.39 years. Another important situation revealed by the tables is that the mortality is very much lower for practically the entire range of life in the rural part of the country. In particular it appears that the most favorable mortality in this country is found among women living in the rural part. The rate of mortality among men aged 15 to 45 living in the rural part in 1901 was more favorable than that among women of the same age, but in 1910 this condition was reversed. Accordingly, without exception, at that time the lowest rates of mortality and highest expectations of life in this country were found among women living in the rural part. It would be interesting to know what conditions led to the lowering in mortality rates among rural women from ages 15 to 45 during the period 1901-1910.

There seems to have been a general improvement in mortality for all classes for the younger ages, that is, to about age 40 for men and age 50 for women, except for the Negro population. Above these ages there is no improvement, and in some cases the mortality in 1910 was actually less favorable than it was in 1901. It would therefore appear from the life tables in a general way that the efforts to improve mortality have been successful for the younger ages and up to ages 40 or 50, depending upon the sex, but for the higher ages, that is, beyond age 50, the tables indicate no signs of improvement.

Some of the tables exhibit irregularities in the rate of mortality between ages 15 and 30. They appear most strikingly in the graphs on pages 244 to 249, where the mortality curves seem to rise too rapidly for a period of years after age 15 and then to remain almost stationary for some years between ages 20 and 30, after which they start up again. Precisely the opposite is observed at the same ages in the graphs for the measure of vitality, pages 284 to 289. There is undoubtedly some cause or combination of causes tending to produce unduly high rates of mortality between ages 15 and 25, particularly in certain classes of the population. If the cause could be discovered it might be possible to effect a considerable reduction in the rates of mortality in this important age group.

#### GRAPHIC REPRESENTATION OF LIFE TABLES.

8. Part IV of this volume, pages 241 to 293, is devoted to graphs or curves plotted to scale of various mortality functions appearing in the life tables. The plotted curves are rate of mortality per thousand, number of survivors, number of deaths, complete expectation of life, and measure of vitality. The graphs are frequently drawn to several different scales on the same plate or page when it is found necessary to separate the curves. The general plan has been to choose the horizontal and vertical scales so that the different curves can be clearly distinguished on the plate. The scales were also chosen so large that the values of the functions plotted can be read without difficulty, in some cases even to the nearest tenth.

The graphs will be found particularly useful when it is desired to compare the rate of mortality, the expectation of life, or some other function for one area or class with the corresponding graphs for another area or class. For example, the differences between the rates of mortality among whites and Negroes are much more readily grasped by examining the graphs on page 248 than would be possible from an examination of the corresponding columns of figures in the life tables. In general, it may be stated that the graphs should be used where one desires to obtain a comprehensive grasp of the fluctuations or variations of one or more of the mortality functions for a group of ages or for the entire range of life. While it

would be quite impossible to hold clearly in mind a long series or column of figures, they can readily be grasped in their entirety by means of a graph or curve. The typical plate contains four graphs or curves exhibiting the ordinates of some mortality function for males and females in 1901 and 1910. Other classes and areas compared by means of graphs include whites and Negroes, cities and rural, United States and foreign countries, and the mortality experience of life insurance companies in this and other countries. The distinction between the direct use of life tables and graphs is easily made. The former are to be preferred when two or three values of a function are desired at specified ages; the latter are to be employed when it is desired to obtain a general knowledge of the variation of a function for an extended series of values or to compare the variations of a given function for different classes of the population.

#### MORTALITY IN OTHER COUNTRIES.

9. How do the probabilities of life and death in the United States compare with those of peoples living in other countries? This is one of the first questions which is likely to occur to the reader after an examination of the life tables for this country. In order to make this comparison life tables have been included for representative countries in different parts of Europe. The Orient is represented by life tables for Japan and India and the Southern Hemisphere by tables for Australia. They have been selected, so far as possible, for about the same epoch or period of time as the United States Life Tables. All the important values, including the rate of mortality per thousand and the expectation of life at each age, both for males and for females, are shown for these countries.

The rates of mortality for the general population in this country probably approach more nearly those of England than those of any other country, although they are generally less favorable in this country than in England. It may be stated in a general way that the rates of mortality among white persons in this country are less favorable than those of most of the foreign countries from age 20 to between ages 60 and 70. The rates of mortality in the rural part of this country approach more nearly those of the general population of Australia than those of any other foreign country. It is quite impossible to make any sweeping statement, except for India, about the mortality of any one country as compared with that of any other. An examination of the graphs on pages 250 and 251 shows that there are numerous crossings and recrossings of these curves, so that while the mortality in a certain country may be very favorable for a definite range of ages as compared with that of the other countries, the reverse is likely to be true for some other range of ages. For example, the rate of

mortality in Sweden after age 35 is easily below that of all other countries, but under age 35 it is not as favorable as in Australia, under age 30 not as favorable as in England and Germany, and not as favorable as in this country under age 25 down to about age 5, where the curves again begin to cross and recross. The failure of Sweden to maintain its favorable position from ages 5 to 35 is largely due to the causes producing the irregularity mentioned in section 7, this irregularity being most pronounced in the graphs of Sweden and Italy. The mortality in India is shown by the graphs to be so much higher than that of all the other countries that it is in a class by itself.

#### MORTALITY TABLES OF INSURANCE COMPANIES.

10. Several tables are included which are derived from experience on insured lives and used in this and other countries by insurance companies. Tables of this character differ materially from census life tables chiefly on account of what is known as "medical selection." The insurance company does not issue the policy and accept the risk until after the applicant has passed a satisfactory medical examination. This means that the aggregate of policyholders in an insurance company is healthier than the general unselected census population, and explains why the rate of mortality is lower in this group than in the census group, particularly in the earlier years of insurance, within five or ten years after date of policy and medical examination. Among the insurance mortality tables included are those employed in this country by the legal reserve, industrial, and fraternal companies, and a number of those employed in other countries by old line companies.

#### LIFE ANNUITIES, PREMIUMS, AND COMMUTATION COLUMNS.

11. There are many occasions in legal practice when information afforded by life tables is required. This is particularly the case in valuing or estimating the measure of damages in the event of death by accident. It is also frequently necessary in dividing estates to be able to determine the values of annuities and reversions based upon life tables. Tables of life annuities and reversions at various rates of interest are included, and in order to facilitate the calculation of other values which may be required in practice, commutation columns, including the usual functions, have been prepared. In the absence of mortality tables based upon census statistics of this country, the courts have been obliged until recently to employ a variety of tables, such as the Northampton, Carlisle, and American Experience, which do not accurately represent mortality conditions in the general population in this country. The life tables which have been chosen for this purpose are those for white males in the original registration states, 1910, and white females in the original registration states, 1910. Each of these tables is based upon a population of

about 12,000,000 and reported deaths of about 500,000, and may be regarded as furnishing a very reliable measure of the rates of mortality and the expectation of life now prevailing among white persons in this country. The annuities, premiums, and other monetary values derived with the aid of the commutation columns may likewise be regarded as closely conforming to present mortality conditions.

#### THEORY OF LIFE TABLE CONSTRUCTION.

12. A considerable portion of the text is devoted to a description of the methods employed in preparing these tables. The formulas are demonstrated in detail and accompanied by numerous explanatory diagrams and illustrations. This part is designed chiefly for the information of students and actuaries who desire to know about the methods employed and who are able to make suggestions for improvement in the construction of future tables. The United States Life Tables in this volume are based upon the census enumerations of 1890, 1900, and 1910 as to populations, and the reported deaths for the census year of 1890 and the twelve calendar years 1900 to 1911. With these original statistics the life tables were constructed from ages 5 to about 85 by the method of osculatory interpolation, employing fifth differences. Natural numbers instead of logarithms were used, and the populations and deaths were interpolated separately. Where the original statistics were given in single ages, these were grouped in quinquennial sets of 4 to 8, 9 to 13, 14 to 18, and so on.

The rates of mortality for the first five years of life were calculated, with some modifications, by the method employed in constructing the German life tables for the decennium 1891-1900, and the interval from age 5 to age 13 was bridged over by ordinary fourth difference interpolation formulas. The birth registration statistics employed were those for Massachusetts and Boston in 1901 and 1910, and the cities of New York and Philadelphia in 1910. At the advanced ages a modification of Wittstein's formula was employed, the rate of mortality being taken as unity at age 115. In order to join the osculatory interpolation with the Wittstein graduation, Spencer's 21-term formula was employed over a range, usually small, sufficient to insure a smooth junction. In all cases great care was exercised to disturb the original data as little as possible.

On account of this practice some of the tables are irregular at points. It would not be difficult to iron out these irregularities in all cases by the employment of powerful smoothing formulas. Since, however, it is not always easy to distinguish the irregularities which are characteristic of the population from those which are due merely to defective enumeration and mortality returns, it was deemed better to present these life tables in an approximately unadjusted form.

## DETAILED CONSTRUCTION OF ONE LIFE TABLE.

13. The theory of construction of life tables has to do largely with the development of formulas and general methods and is chiefly of interest to actuaries and students of actuarial mathematics. To meet the requirements of students who would like to reproduce any life table in this volume from the original data or apply the same processes to other data, the numerical work, step by step, in the construction of a typical life table is given in Part VII of this text. The table chosen for this purpose is that for males in the state of New York, 1910. In the construction of this life table there are more than a hundred steps, each of which is described in the text and illustrated by a series of photographs of the actual calculations made upon the adding machine and otherwise. These calculations are set forth in definite order, in accordance with the plan finally adopted after considerable experience and experimentation with the numerical work of life table construction. This portion of the text will be of great assistance to those who desire to learn the processes of construction without going into the mathematical theory. No attempt has been made to describe abridged methods of constructing life tables.

## VARIATIONS FROM STANDARD CONSTRUCTION.

14. The construction of the life tables for males in the state of New York, 1910, referred to in the preceding section, proceeds along certain lines which may be regarded as typical, or standard. When it is remembered, however, that there are seventy-four different life

tables, and that the original statistics for the various areas, classes, and periods are not homogeneous, it is easy to understand why it would be quite impossible to apply one and only one process to obtain them all. For example, when bridging processes are employed to connect the curve of infant mortality rates with that determined by fifth difference osculatory interpolation, and again, at the older ages, to join the end of the latter curve to the Wittstein old age curve, it is evident that the points of junction will vary from table to table. In order to meet this situation, several pages of the text are devoted to an outline of construction of all the life tables. This outline gives the additional information about each table needed to enable actuaries and students to reproduce it.

## ORIGINAL STATISTICS.

15. The original statistics from which all the United States Life Tables were derived are population and mortality statistics furnished by the Census Bureau. These statistics are reproduced in this volume. They include enumerated and estimated populations, reported deaths, and birth registration statistics so far as employed. They are presented in order that the life tables which are based upon them may be verified by those interested in the subject. A more important reason, however, for presenting them is to stimulate further investigation in life table construction, with the thought that many suggestions may be made which will be useful in the construction of future life tables.

## PART I

NONTECHNICAL DESCRIPTION AND EXPLANATION OF LIFE TABLE FUNCTIONS,  
GRAPHS, AND OTHER PARTS OF TEXT AND TABLES

---

7

## PART I.—NONTECHNICAL DESCRIPTION AND EXPLANATION OF LIFE TABLE FUNCTIONS, GRAPHS, AND OTHER PARTS OF TEXT AND TABLES.

### EXPLANATION OF LIFE TABLE FUNCTIONS.

#### LIFE TABLE HEADINGS.

16. In order to assist the reader to understand and make intelligent use of the life tables, an explanation is made of the nine columns appearing in each life table. For purposes of illustration, the life table for white males in the original registration states, 1910, pages 68 and 69, is selected.

In general, the heading of each column is made up of four parts. The first part is a brief descriptive heading, the second part explains in greater detail the meaning of the figures in the column, the third part gives the algebraic symbol usually employed by actuaries to represent the function whose values appear in the column, and the fourth part gives the number of the column for convenience of reference.

#### AGE INTERVAL, $x$ to $x+1$ , COLUMN 1.

17. This column indicates the *age interval* to which the figures set forth in the other columns refer. An age interval may be defined as the period of lifetime between two exact ages. For example, the age interval 35-36 is the year of lifetime between *exact* age 35 and *exact* age 36. The beginning of this age interval is at exact age 35, and the interval covers all intervening fractional ages, such as 35 years, 3 months, 17 days. The age interval ends with exact age 36. An age interval is different from an age because it covers an interval or period of time. A person is at a given exact age, say 40, only an instant; one day later his age is 40 years, 1 day.

The *current* age interval is the age interval in the same line or row with the value of the function in the body of the table. Of two age intervals, the one farther down in the table including older ages is said to be the *older* age interval.

The first year of life is subdivided into age intervals of one month to show in greater detail the rapid changes in infant mortality. The life table then begins anew and proceeds by age intervals of one year over the entire range of life.

#### GENERATION OF 100,000 BORN ALIVE.

#### NUMBER OF SURVIVORS, $l_x$ , COLUMN 2.

18. This column exhibits the number of persons alive at the beginning of each age interval out of a generation of 100,000 males born alive. The words "born alive" are used advisedly and are intended to call attention to the fact that stillbirths are excluded and the column refers only to survivors of living births. Particular attention is called to the fact that the number alive means those alive at the *beginning* of the age interval.

For example, there are 77,047 alive at exact age 25, which is the beginning of the age interval 25-26. Similarly, there are 89,453 alive at exact age 8 months, which is the beginning of the age interval 8-9 months.

The 100,000 is a hypothetical number assumed for convenience. It may also be added that the generation of 100,000 males under observation from birth need not necessarily be assumed as born at the same time; the main point is that each one is kept under observation from the date of birth, whatever time that may have been, and it is noted how many are alive at exact age 1 month, at exact age 2 months, and so on to exact age 1 year, exact age 2 years, and so on to the end of life.

If infants in the hypothetical generation of 100,000, instead of being born simultaneously, are assumed as born uniformly throughout the calendar year, approximately 8,333 would be born in January and the same number in February, March, and so on to the end of the year. If this number of births continued each year and there were no emigration and immigration, a living population would eventually arise which would contain persons living at all ages, integral and fractional. Column 6 shows the population alive in each age interval on this hypothesis; for example, 8,031 persons are living at all ages under 1 month, that is, in the age interval 0-1 month. Similarly, 7,878 are living in the age interval 1-2 months. Adding up the populations in the twelve monthly age intervals, it appears that a population of 91,126 white males is living in the age interval 0-1 year. 100,000 infants were born uniformly throughout the year, but, owing to the deaths which took place in accordance with the mortality rates in column 4, there are only 91,126 living in the age interval under 1 year.

Columns 1 and 2 are the fundamental columns of the life table, and the remaining columns are derived from them by means of mathematical processes. The characteristic feature of column 2 is that it shows the decrement of life from interval to interval throughout the whole range of life. For example, of the 100,000 born alive 78,729, or little more than three-fourths, attain exact age 21. Not until age 59 is the original number, 100,000, reduced about one-half, namely, to 50,435. The allotted threescore and ten years is attained by 31,527, and a little over one-tenth, 10,509, of the original number live to be 81 years of age. Less than one-twentieth, 4,162, live to be 86; less than one one-hundredth, 829, live to be 92; and less than one one-thousandth, 82, attain age 98. Only 31 of the original 100,000 attain age 100.

NUMBER DYING,  $d_x$ , COLUMN 3.

19. This column shows the number dying in the corresponding or current age interval out of a generation of 100,000 males born alive. It is merely the decrement in column 2 and is obtained by taking the difference between the successive numbers in column 2. For example, column 2 shows that there were 79,116 persons alive at exact age 20 and 78,729 persons alive at exact age 21. Accordingly, the difference, 387, must be the number of persons dying in the age interval 20-21.

Referring first to the infant mortality table, the greatest number of deaths occurs in the first month of life, 4,844 dying in the age interval under 1 month. There is a rapid decrease in the number of deaths, only about one-fourth of this number, namely, 1,242, dying in the second month of age. After this the decrease is not so rapid, but by the twelfth month the number of deaths has decreased to 399. It is evident that about one-half of the 12,326 deaths under 1 year occur in the first two months of life, and that the number of deaths occurring in the twelfth month is less than one-twelfth of the number of deaths occurring in the first month.

Passing to the general life table, proceeding by age intervals of 1 year, it is seen that 12,326 of the 100,000 born during the year die under 1 year of age; in other words, about one-eighth of all the males born alive die under 1 year. There is a great improvement in the second year of life, as only 2,473 die in the age interval 1-2 years, that is, between exact ages 1 and 2. The number of deaths decreases rapidly until age interval 11-12 years, the most favorable period in life, when only 185 deaths take place. The number of deaths gradually increases from this point, reaching a maximum of 2,005 in the age intervals 73-74 and 74-75, and decreasing from that time until the last survivor of the hypothetical group of 100,000 dies in age interval 105-106.

The deaths shown in column 3 are those which take place in the succeeding age intervals in a constantly diminishing group of persons living in the corresponding age intervals. For example, 494 deaths occur in the age interval 30-31 among 74,810 who are alive at exact age 30, whereas 1,959 deaths occur in the age interval 70-71 among 31,527 alive at exact age 70, and 94 deaths occur in the age interval 95-96 among 289 alive at exact age 95. Since column 3 shows the number of deaths occurring in each age interval among a diminishing number of persons living at the beginning of the respective age intervals, these figures can not give an adequate idea of the rate of mortality. In order to compare the rate of mortality for different age intervals, the number of deaths which would occur in each interval among the *same number* of persons alive at the beginning of the age interval must be known. The next column gives this information.

RATE OF MORTALITY,  $1000q_x$ , COLUMN 4.

20. This column shows the rate of mortality per thousand, in other words, the number dying in each age interval among 1,000 alive at the beginning of the age interval. For example, in the age interval under 1 month the rate of mortality is 48.44, indicating that of 1,000 living births 48 die under 1 month. The rate of mortality for the second month of life is about one-fourth of what it is for the first month of life and diminishes rapidly, being only 4.53 for the twelfth month of life. It should be noted carefully that these are *monthly* rates.

Passing to the life table proceeding by age intervals of 1 year, it is seen that the rate of mortality for the first year of life is 123.26, or, expressing it in another way, for every 1,000 living births 123 deaths occur under 1 year of age. Similarly, out of 1,000 alive at exact age 1 year, 28 die in the second year of life. The rate of mortality decreases rapidly, reaching its most favorable point at age 11, when it is 2.28, indicating that among 1,000 boys alive at exact age 11 only about two deaths occur in the succeeding year of life. From this point on the rate of mortality gradually increases to age 22, where there is a characteristic slowing up of the increase for a few years until about age 26, when it advances again more rapidly. At age 45 the rate of mortality has increased to 12.64, about the same that it was at age 2. At age 59 it is 28.71, or about the same as at age 1. At age 79 it is 124.98, as much as it was in the first year of life. From this point on it increases rapidly, and in the age interval 105 there are about 583 deaths among 1,000 alive at exact age 105. The tables are so constructed that the rate of mortality reaches its maximum value at age 115, so that of 1,000 males alive at exact age 115 there would be 1,000 deaths during the succeeding age interval. The columns 2 and 3 are not carried beyond age 105, because it would involve introducing fractional lives, and at best the figures at these advanced ages are to be considered as only approximate.

EXPECTATION OF LIFE,  $e_x$ , COLUMN 5.

21. This column expresses the value in years of the complete expectation of life, or the average length of life remaining to each person alive at the beginning of the age interval. For example, the complete expectation of life at birth is 50.23 years. The future years of lifetime which will be lived by the 100,000 persons alive at the beginning of age interval 0-1 are shown in column 8 and are 5,023,371. If the total number of years to be lived is divided by the number of persons, 100,000, the quotient will be the average number of future years to be lived by each person. Column 2 shows 72,108 persons are alive at exact age 35. Column 8 shows that these persons still have 2,241,174 years to live. Dividing the latter number by the former, the average future lifetime of each one

of the 72,108 persons alive at exact age 35 is found to be 31.08 years. This does not mean that each person will live 31.08 years beyond age 35, but that the average number of years still to be lived by all persons who have attained age 35 is 31.08 years. Some will live more than 31 years, some less, but the number shown as the complete expectation of life is the average.

An examination of column 5 reveals the fact that the expectation of life increases about six years in the first year of life, jumping from 50.23 years at birth to 56.26 years at age 1. This rapid increase in the expectation of life is due to the rapid decrease in mortality during the first year of life. The expectation of life increases to 56.88 years at exact age 2 and from this point on steadily decreases throughout life. The expectation of life is given as about 50 years at age 12, 25 years at age 43, 10 years at age 67, 5 years at age 80, and 2 years at age 97.

#### STATIONARY POPULATION.

POPULATION IN CURRENT AGE INTERVAL,  $L_x$ , COLUMN 6.

22. Columns 6, 7, 8, and 9 refer more particularly to a *population*. There is a sharp distinction between column 2 and column 6, which has already been brought out to some extent in the discussion of column 2. Column 2, as has been pointed out, indicates the number alive at the *beginning* of each age interval, or at each exact age, among 100,000 living births under observation throughout the range of life. No assumption is made necessarily as to whether these births take place simultaneously or at different times. Column 6, however, represents the population which would eventually arise if 100,000 living births were distributed uniformly throughout each year, for example, through each calendar year. It is further assumed that this population is subject to the mortality rates set forth in column 4, also that it is free from emigration and immigration, or that if there is any emigration and immigration it takes place in such manner that its effect upon the population is canceled at each age. On this assumption a population would come into existence and persons at *all fractional ages* would be living in each age interval. For example, the 81,422 persons living in the age interval 10-11 are the survivors of the 100,000 persons who were born between 10 and 11 years ago uniformly distributed throughout the year. Eventually a maximum population would be evolved and the number of persons living in each age interval would be as set forth in column 6. This population is not affected by emigration and immigration, and will eventually become stationary or constant as to the number of persons contained in it. Since it is a stationary or constant population, the number of deaths in each year must be the same as the number of births, that is, 100,000 deaths take place each year in the complete population. The 100,000 deaths take place in this population in the age intervals as recorded

in column 3, and the rate of mortality in this population is in accordance with the figures shown in column 4. The above remarks amplify the general heading over columns 6, 7, 8, and 9.

Another way of looking at column 6 is to regard the population set forth as a hypothetical population arbitrarily set up or established. It would remain stationary as to numbers and composition if 100,000 males were born alive uniformly throughout each year, provided it were unaffected by emigration and immigration and it were subjected to the rates of mortality appearing in column 4. From this point of view it may be regarded as the standardized stationary population supported by a fixed or constant number, 100,000 of living births, and subject to the particular rates of mortality now in effect in the community on which the life table is based. With this understanding, the standardized population of different communities may be compared. The comparison is one in which the effects of emigration and immigration are eliminated and involves only the actual mortality rates in effect in the communities compared.

Column 6 shows that there are only 8,031 living simultaneously at all fractional ages in the age interval 0-1 month among the 8,333 persons born during the month preceding the date of the enumeration. Similarly, there are only 7,878 living simultaneously at all fractional ages in the age interval 1-2 months. Adding up the population by months in column 6, it is found that the population under 1 year of age is 91,126. The population living in the age interval 1-2 years is 86,215, and so on throughout the range of life. The figures in column 6 would result from taking a census of this hypothetical community at any time. For example, if a census were taken on *any* fixed date it would be found that there were 78,922 persons living in the age interval 20-21, 60,270 persons living in the age interval 50-51, 1,329 persons living in the age interval 90-91, and so on.

MEASURE OF VITALITY,  $\lambda_x = L_x/d_x$ , COLUMN 7.

23. This column is found, except for infant mortality, by dividing the figures in column 6 by the corresponding figures in column 3. Since column 6 gives the population living in the current age interval and column 3 gives the number of deaths occurring annually in the current age interval, the quotient will be the population per death per year in the current age interval. For example, in the age interval under 1 year the living population is 91,126 and the number of deaths per year is 12,326; the ratio of the former to the latter is 7.39, indicating that to every 7.39 persons in the population living in age interval under 1 year there is one death per year in this age interval. In the age interval 1-2 years there is one death per year to about every 35 persons living between exact ages 1 and 2. It is evident that

the larger the number in this column the more favorable is the mortality. Passing down the column, it is observed that the maximum value of the population per death per year is 439.09 at age 11, indicating that among boys between ages 11 and 12 there is one death per year to about every 439 in the population. This favorable condition is more than cut in half by age 20, because in the age interval 20-21 one death occurs each year to about every 204 persons. This figure is again cut in two by the time age 39 is reached. In this age interval one death occurs each year to every 101 persons in the population. It is halved again at age interval 54-55, again at age interval 63-64, and so on throughout the remaining range of life. It is interesting to note that at one point column 7 shows a decided slowing up in this decrease of what may be called the *measure of vitality*. For example, in passing from age interval 22-23 to age interval 25-26 the measure of vitality diminishes only by one or two between each age interval, but before and after these ages it diminishes much more rapidly.

Special attention is directed to the meaning of column 7 in the introductory table on infant mortality. Referring to the first age interval, 0-1 month, there are 8,031 in the population. There would not be 4,844 deaths in this population in one month. The 4,844 deaths would occur in one year, because this is the number of deaths occurring among 100,000 living births and the 100,000 living births do not occur simultaneously but are uniformly distributed throughout the year. Consequently, only one-twelfth of 4,844, namely, 404, deaths occur in *one month* corresponding to the population of 8,031. The 404 deaths occur in part among the 8,031 living at the beginning of the month and in part among those born during the month. The result is that, corresponding to a constant or stationary living population of 8,031 persons under 1 month, the number of deaths *per month* of persons under 1 month is 404.

Interpreting the infant mortality column 7 in accordance with this explanation, it appears that to every 19.92 in the population under 1 month of age there is one death per month in this age interval, or, to put it in another way, the population per death *per month* is 19.92 in the age interval under 1 month. This condition rapidly improves as the first year of life advances. There is one death per month to about every 76 in the population in age interval 1-2 months; one death per month to about every 148 in the age interval 6-7 months; and one death per month to about every 220 in the age interval 11-12 months. If it should be preferred to indicate in the infant mortality table of column 7 for each monthly age interval the population per death *per year* in the same age interval, the figures now appearing should be divided by 12.

POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS,  $T_x$ ,  
COLUMN 8.

24. This column represents the total population alive in current and all older age intervals, and is found by adding the population in column 6 from the current age interval to the end of the table. For example, referring for convenience to age intervals near the end of the table, it is noted that in the age interval 100-101, column 6, the living population is 24 and in the succeeding or older age intervals 14, 7, 4, 2, and 1, respectively. These figures add to 52, which is the number appearing in the corresponding age interval, 100-101, in column 8. Similarly, beginning with 11,335 in age interval 80-81, column 6, and adding to it the populations in the succeeding or older age intervals to the end of the table, it is found that there are 61,915 persons, as shown in column 8, living in the population in the current age interval 80-81 and all older age intervals.

Column 8, therefore, represents the sum of the populations at ages above the *beginning* of the current age interval. For example, the *total population* is 5,023,371, because it is the sum of populations at all ages after birth. The population aged 20 years and older is 3,378,969. It is evident from an examination of column 8 that about half the population is under 31 and half over 31 years of age; that about one-fourth of the population is over age 50 and about one-tenth of the population over age 64.

Column 8 not only represents the total population at a given age and older, but also represents the total number of years of future lifetime which will be lived by those alive at the beginning of the current age interval represented in column 2. For example, the 79,116 persons alive at exact age 20, column 2, will live a total of 3,378,969 more years. Consequently, as explained before in section 21, the average future lifetime of each one of these individuals at exact age 20, found by dividing column 8 by the corresponding number in column 2, is 42.71 years, and is called the complete expectation of life.

DEATH RATE PER THOUSAND,  $1000l_x/T_x$ , COLUMN 9.

25. This column, the last one appearing in the table, exhibits the average annual death rate per thousand of the population living in current and all older age intervals. In other words, it shows the average annual death rate in the population exhibited in column 8. For example, the average annual death rate in the total population of 5,023,371 is 19.91. It is found by dividing the number in column 2 by the corresponding number in column 8 and multiplying the quotient by 1,000. Column 2 also represents the annual number of deaths in the population living in current and all older age intervals. For example, there are 80,549 deaths each year in the population of 3,778,442 persons of age 15 and over. Dividing the

former by the latter and multiplying by 1,000, the average annual death rate of the population living in the age interval 15-16 and all older age intervals is found to be 21.32 per thousand. This column enables one to compare the average annual death rate per thousand in various portions of the populations in different communities. In the life table for white males of the original registration states the average annual death rate for the entire population is 19.91. It decreases to 17.58 in age interval 2-3 and from that point increases steadily to the end of the table. At age 32 it has advanced to 30 per thousand, at age 60 to about 71 per thousand, and at age 70 to 113 per thousand.

#### TO DETERMINE AVERAGE ANNUAL DEATH RATE PER THOUSAND.

26. By means of columns 8 and 2 the average annual death rate for particular sections of the population

can easily be obtained for purposes of comparison. For example, to determine the average annual death rate per thousand of the population living between ages 50 and 60, add the number of deaths between ages 50 and 60 in column 3; the population living in the age intervals 50 to 60 in column 6, divide the former by the latter, and multiply by 1,000. The number of deaths in column 3, age intervals 50-51 to 59-60, inclusive, is 11,754; the number living in the population in age intervals 50-51 to 59-60, inclusive, is 553,517. Performing the indicated division and multiplication, 21.24 is found as the average annual death rate per thousand in the population living between exact ages 50 and 60.

The same result might have been obtained more easily by applying the formula:

$$1000 \left( \frac{l_{50} - l_{60}}{T_{50} - T_{60}} \right).$$

### QUESTIONS AND ANSWERS ILLUSTRATING USE OF TABLES AND GRAPHS.

#### SCOPE AND PURPOSE OF THESE QUESTIONS AND ANSWERS.

27. In order to illustrate the kinds of information which may be obtained from these life tables, twenty-one pages of questions and answers are given in this part. The questions are answered in detail to instruct the reader in the necessary steps to be taken to secure the information. The table is named and the number of the page and the number of the column where the value of the required mortality function can be found are given.

Almost every part of this volume after Part I is covered by these questions and answers. Although most of the questions are about the United States Life Tables and the graphs of life table functions, some attention is given to the life tables of foreign countries and the mortality tables of insurance companies. Questions are also proposed which illustrate the use of the tables of annuities and the commutation columns based on the United States Life Tables.

Considerable care has been given to the selection of the questions so as to distinguish between the direct use of the life tables and the graphs of the functions. They have also been chosen so as to require the consultation of many different tables in order to familiarize the reader with them.

Any conclusion arrived at by the use of these tables is necessarily predicated on the rates of mortality existing at the epochs or during the periods for which they were constructed, in particular, for the United States Life Tables, for 1890, 1901, 1910, and the ten-year period 1901-1910.

#### RATES OF MORTALITY.

##### ANNUAL RATES OF MORTALITY.

28. Q. What was the annual rate of mortality per thousand among young people aged 21 in the original

registration states in 1910?—A. Turning to Table 2 on page 54, the life table for both sexes in the original registration states in 1910, it is found in column 4 that the annual rate of mortality per thousand at age 21 is 5.00. In other words, on the average there were 5.00 deaths between exact ages 21 and 22 among each thousand persons alive at exact age 21.

Q. At what older age was the annual rate of mortality per thousand among persons in 1910 twice the rate at age 21?—A. Age 42, the rate of mortality being 10.09 per thousand. See column 4 of Table 2, page 54.

Q. At what ages were the annual rates of mortality per thousand among persons in 1910 four times, twenty times, fifty times, and one hundred times, respectively, the rate at age 21?—A. At age 55 the annual rate of mortality per thousand was 20.03; at age 77 the rate was 101.74; at age 90 the rate was 249.62; at age 105 the rate was 500.22. See column 4 of Table 2, page 55.

Q. What was the lowest annual rate of mortality per thousand in the original registration states in 1910?—A. 2.19, the rate at age 11, as shown in column 4 of Table 2, page 54.

Q. What was the annual rate of mortality per thousand among children aged 5 in the original registration states in 1910?—A. 4.66 was the rate at age 5 according to column 4 of Table 2, page 54. The annual rate of mortality at age 5 was about double that at age 10; it was also about the same as that at age 20, which was 4.68.

#### GRAPHIC REPRESENTATION OF RATES OF MORTALITY.

29. Q. What would be the appearance of the curve plotted from these values according to ages?—A. This curve is shown in Graph 1, page 243, from birth to age 100. It is roughly U-shaped, with the

base of the U extending from about age 2 to about age 50 and the left arm only about one-fourth the height of the right arm but much steeper.

Q. Could the first five questions be answered from Graph 1 on page 243? In other words, is it possible to read the rates of mortality from this graph?—A. Only approximately from age 3 to age 50; before and after these ages the rates can be read fairly accurately to the nearest integer.

Q. If the rates of mortality of any of the other life tables were also plotted on this page, would their curves generally be higher or lower than this one?—A. With the exception of those for Negroes, India, Massachusetts in 1890, and some of the cities, the curves for any of the life tables shown in this volume would practically coincide with this curve between ages 3 and 50.

Q. Is it possible to draw these curves on a page of this size so that the curves for different tables do not coincide and so that the values of the rates of mortality can be read from the graphs to a fair degree of accuracy?—A. In Graphs 2 to 11, pages 244 to 253, showing the rates of mortality per thousand, this has been accomplished by drawing different parts of the curve to different scales, so that each graph contains at least three diagrams, A, B, and C. Since corresponding diagrams on all these graphs have exactly the same scales, it will suffice to explain one graph.

Turning to Graph 2 on page 244 as a sample, it will be seen that there are four diagrams, three of which, A, B, and C, show the *annual* rate of mortality per thousand, while D shows the *monthly* rate of mortality per thousand. Diagram C, on the extreme right, has almost the same scale as that to which the rates of mortality per thousand of both sexes in the original registration states is drawn in Graph 1, page 243. The curves in Diagram C bear a strong resemblance between ages 50 and 100 to the curve in Graph 1.

In Diagram A, the one on the extreme left, the vertical scale is twice that in Diagram C, as can be seen by comparing their values at the top of the page, 300 and 600, respectively. However, the horizontal or age scale in Diagram A is nearly eight times that in Diagram C, but extends only from birth to age 3. The large horizontal scale in Diagram A permits the separation of the curves between ages 0 and 1 year and the indication of *approximate annual* rates of mortality per thousand at each month of age under 1 year.

Q. What is the advantage of showing several curves or graphs on the same diagram when the values from which they were plotted are shown in column 4 of the different life tables?—A. In order to compare several tables without the aid of their graphs it would be necessary to turn from page to page and look up hundreds of different values and at the same time hold them all in mind. The graphs show at a glance all the variations and differences for the entire range of life.

#### ANNUAL RATES OF MORTALITY UNDER 1 YEAR.

30. Q. What were the annual rates of mortality among males in the original registration states in 1901 at birth, 3 months, 6 months, 9 months, and 1 year of age?—A. In Graph 2, page 244, it will be noted that the curve for males in 1901 is a line of short dashes, ----- . Since the curves immediately after birth are so steep that their initial values are hard to read, the values at birth, on the vertical line 0 at the extreme left of Diagram A, are printed on the graph, together with the name of the table and an arrowhead at the beginning of the curve. About 136 out of 1,000 male children born alive in 1901 died during the first year of life. Following this ----- line to about one-fourth the distance between the vertical lines 0 and 1, it will be seen that out of 1,000 male children 3 months of age in 1901 about 87 died before they were 15 months of age. About midway between the vertical lines 0 and 1 the ----- line is opposite 66 on the vertical scale; hence this is approximately the annual rate of mortality per thousand among male children 6 months of age in 1901. The reading is 47 on the vertical scale at the point where the ----- line is about three-fourths the distance between 0 and 1 year of age, and the reading is 35 where it crosses the vertical line 1.

Q. How were these annual rates of mortality under 1 year determined?—A. See section 132, page 364.

#### COMPARATIVE RATES OF MORTALITY.

31. Q. What were the rates of mortality at age 25 among males in 1901 and 1910 and among females in 1901 and 1910?—A. In Diagram B of Graph 2, page 244, the ----- line, males 1901, crosses the vertical or age line 25 at a point opposite 7.2 on the vertical scale immediately to the left of Diagram B; the ----- line, females 1901, crosses this line at a point opposite 6.9 on the vertical scale; the ----- line, males 1910, at 5.7; and the ----- line, females 1910, at 5.4. It will be noted that the values on the curves in Diagram B can be read easily to one-tenth, for they are on a large scale, the top value in Diagram B being 40, while those in Diagrams A and C are 300 and 600, respectively. Thus the vertical scale in Diagram B is 7.5 times that in Diagram A and 15 times that in Diagram C. It begins at age 3, repeating on its larger scale the last value in Diagram A, and extends until the rates of mortality are 40 per thousand. In Graph 2 this is between ages 63 and 67. Then Diagram C begins at age 50, repeating on its smaller scale the last ten to fifteen values shown in Diagram B, and extends to age 100.

Q. How did the rates of mortality among males in New York City vary between 1901 and 1910?—A. The rates in 1910 were lower than those in 1901 for all ages except between ages 61 and 64, where the 1910 rates were slightly higher than those for 1901. See column 4 of Tables 67 and 68, pages 184 to 187.

Q. Was there much change between 1901 and 1910 in the annual rate of mortality per thousand among males in the original registration states?—A. Starting with Diagram A of Graph 2, page 244, it will be observed that the annual rate of mortality at birth among males was 135.74 in 1901 and 124.95 in 1910, so that the decrease in the nine years was 10.79 per thousand, or an average decrease of about 1.2 per thousand per year.

It will be noticed that the ----- line remains above the ——— line in Diagrams A and B up to about age 42, after which they practically coincide, or else are not far apart, up to about age 87 in Diagram C. This indicates that there was considerable decrease during the nine years in the rates of mortality from birth to about age 40, but from that age on the rates of mortality either remained practically the same or else slightly increased.

The rates of mortality beyond age 85 were influenced to a slight extent by the hypothesis that the limit of life was the same for all tables, namely, age 116. For example, if the rates in table *a* were lower than those in table *b* before age 85, they would have to increase more rapidly after age 85 than those in table *b* in order to reach the same limit of life as those in table *b*.

#### CHARACTERISTIC CHANGES IN RATES AMONG MALES.

32. Q. Was this change in the rate of mortality among males characteristic of all sections of the country, or did it occur only in certain groups?—A. Turning to Graph 4 on page 246, on which are shown the rates of mortality per thousand among whites in cities of the original registration states in 1901 and in 1910, it will be noted that the decrease in the annual rate of mortality at birth during the nine years is  $150.97 - 133.80 = 17.17$ , or nearly 2 per thousand per year. After this the ----- line remains above the ——— line until about age 58, after which the lines either coincide or else remain very close together.

Turning to Graph 5, page 247, showing the rates of mortality per thousand among whites in rural parts of the original registration states in 1901 and in 1910, it will be seen that the decrease in the annual rate of mortality at birth between 1901 and 1910 is  $109.00 - 103.26 = 5.74$  per thousand, or only about one-third of the decrease among white males in cities. Also the ----- line remains above the ——— line only up to about age 34, and after that the two lines practically coincide, or the ----- line is lower than the ——— line up to extreme old age.

Turning to Graph 3, page 245, on which are shown the rates of mortality per thousand among Negroes in the original registration states, it is seen that during the nine-year period the decrease in the annual rate of mortality at birth is  $253.26 - 219.35 = 33.91$ . This is a great drop, being nearly 4 per thousand per year. However, the rates among Negroes are about twice as high as among whites. The ----- line

remains above the ----- line only up to age 20, after which it is generally considerably lower than the ----- line up to old age.

Turning to Graph 10, page 252, showing the rates of mortality per thousand in Massachusetts in 1890, 1901, and 1910, it appears that the annual rate of mortality at birth drops from 158.78 in 1901 to 137.06 in 1910, or 21.72. Except among Negroes, this is the greatest improvement found so far, but the rate in 1901 was very high and was still high in 1910. The males, 1901, line -----, remains above the males, 1910, line ———, up to about age 50 and then either coincides with it or is only a little below it up to old age. Thus it seems that the decrease in the annual rate of mortality among males at birth was greater in Massachusetts than in any of the other tables investigated, except those for Negroes.

No graphs were drawn of the native whites in the original registration states, but by comparing the values in column 4 of Tables 19 to 22 (the four life tables for native whites, males and females in 1901 and in 1910, pages 88 to 95) with those in column 4 of Tables 7, 9, 10, and 12 (the four corresponding aggregate white populations, pages 64, 68 to 71, and 74) it will be found that while the rates for native whites are generally a little lower than those for the aggregate white population, there is so little difference that their curves would practically coincide even on the large scale in Diagram B.

What has been said just above concerning the tables of mortality for native whites in the original registration states applies also to those for foreign whites in the original registration states, except that where the rates for native whites are a little lower than those for the aggregate white population, those for the foreign whites are generally a little higher, and *vice versa*.

#### MONTHLY RATES OF MORTALITY.

33. Q. In section 30 it was shown that the approximate values of the *annual* rates of mortality by months under 1 year of age could be read from the graphs in Diagram A. Why, then, is it necessary to show the *monthly* rates of mortality in Diagram D?—A. The rate of mortality changes so rapidly during the first year of life that it is necessary to choose a smaller unit interval of time, as the month, in order to satisfactorily measure the variations.

Q. Is the *annual* rate of mortality at any given age under 1 year equal to twelve times the *monthly* rate at this age?—A. No; because the *monthly* rate is based upon the number of deaths during only the first *month* following the given age, while the *annual* rate is based upon the deaths during the first *year* following the given age. If there is a rapid decrease from month to month in the number of deaths, it is evident that the annual rate of mortality would be much

lower than twelve times the monthly rate, and this is the case in the first year of life.

An illustration of this can be seen by turning to Table 48 on page 146, the life table for males in the state of Michigan, 1910. At the top of column 4 it will be noted that the *monthly* rate of mortality at birth is 51.77 per thousand, so that twelve times this rate would be over 600 per thousand, while lower down in column 4 it appears that the *annual* rate of mortality at birth is only 113.68 per thousand.

Q. What is the meaning of the monthly rate of mortality at birth, 51.77 per thousand, mentioned just above?—A. It means that out of 1,000 infants born alive 51.77 will fail to survive to the end of the first month of life. In other words, 51.77 of this group of 1,000 infants born alive will die within one month after birth.

Q. What was the monthly rate of mortality in the first month of life among white females living in the rural part of the original registration states in 1910?—

A. Referring to Table 34, page 118, column 4 of the infant mortality section of the table shows that at birth the monthly rate of mortality per thousand was 35.86. This means that on the average there were 35.86 deaths between birth and exact age 1 month among 1,000 females born alive.

Q. What changes occur in the monthly rate of mortality during the first year of life?—A. Turning to Graph 2, page 244, showing the rates of mortality among males and among females in 1901 and in 1910, it will be noted that the curves in Diagram D fall very rapidly, especially during the first month, where the decrease is about three-fourths the height of the ordinates at birth.

Q. Why is the age interval for the first month, that is, the space between the vertical lines marked 0 and 1, about two and one-half times that of any other month?—A. As noted just above, the decrease in the rate of mortality is very great during the first month, so that there is the same difficulty about separating the graphs as during the first year of life. The latter difficulty was overcome by using two diagrams, A and B, where the age interval in A is nearly eight times that in B, but there was not enough room on the page for two diagrams for the monthly curves, so the age interval for the first month only was made longer than for the other months.

Q. How did the monthly rates of mortality under 1 year of age change between 1901 and 1910 in the original registration states?—A. Diagram D of Graph 2, page 244, shows that during the first month of life the monthly rate of mortality was higher in 1910 than in 1901, but beginning with the second month of life this condition was reversed, and by the end of the third month of life the rate for females in 1901 was above that for males in 1910.

#### COMPARISON OF CHANGE IN RATES OF MORTALITY AMONG MALES AND FEMALES.

34. Q. How does the change in the annual rate of mortality per thousand between 1901 and 1910 among females compare with that among males in the original registration states?—A. In Diagram A of Graph 2, page 244, the rate of mortality at birth among females is 112.67 in 1901 and 103.77 in 1910, a decrease of 8.90 per thousand in the nine-year period, but the ----- line, females 1901, remains above the ——— line, females 1910, until age 56, after which the two lines practically coincide for several years, and then their positions are reversed up to old age. Comparing this with the answer to the last question in section 31, it will be seen that the decrease in the annual rate of mortality between 1901 and 1910 was in general greater among females than among males, although not at birth.

Q. In the different sections of the original registration states was the decrease in the rate of mortality between 1901 and 1910 always greater among females than among males?—A. Consulting Graph 4, page 246, showing the rates of mortality per thousand among whites in cities of the original registration states, it will be seen that, while the decrease in the annual rate of mortality at birth is less among females than among males, the ----- line remains above the ——— line several years longer than the ----- line remains above the ——— line.

A glance at the beginning of Diagram A of Graph 5, page 247, which gives the rates of mortality among whites in the rural districts of the original registration states, shows that the decrease in the rate of mortality at birth is less among females than among males, but the ----- line remains above the ——— line over twenty years longer than the ----- line remains above the ——— line.

Again, in Graph 3, page 245, showing the rates of mortality among Negroes in the original registration states, the decrease in the annual rate of mortality at birth is seen to be less among females than among males, but the ----- line remains above the ——— line nine years longer than the ----- line remains above the ——— line.

In Massachusetts, Graph 10 on page 252, the curves for females show a smaller decrease in the annual rates of mortality at birth than do the curves for males, but the ----- line remains above the ——— line about ten years longer than the ----- line remains above the ——— line.

Hence it seems that generally the decrease between 1901 and 1910 in the annual rate of mortality at birth was smaller among females than among males, but the 1910 rates remained lower than the 1901 rates to an older age among females than among males.

Q. From the preceding question it appears that there was always a *decrease* in the *annual* rate of mor-

tality at birth between 1901 and 1910. Was this also true of the monthly rates of mortality at birth?—A. A glance at Diagram D of Graphs 2 to 5 on pages 244 to 247, respectively, shows that there was an *increase* in the *monthly* rate of mortality at birth among the aggregate population, the Negro females, the whites in cities, and the whites in rural districts of the original registration states.

Q. In which division of the population is the increase in the monthly rate of mortality at birth between 1901 and 1910 greatest?—A. Among whites in the rural part of the original registration states. See preceding questions.

#### URBAN AND RURAL RATES OF MORTALITY.

35. Q. What were the rates of mortality per thousand for white males at birth and at ages 10, 20, 40, and 60 in 1901 in cities of the original registration states and in the rural part, and what are the differences?—A. Rates of mortality per thousand among white males in 1901

|                        | at birth | age 10 | age 20 | age 40 | age 60 |
|------------------------|----------|--------|--------|--------|--------|
| in cities were         | 150.97   | 2.97   | 6.29   | 13.54  | 38.15  |
| and in rural part were | 109.00   | 2.29   | 5.04   | 7.13   | 21.68  |
| the differences being  | 41.97    | 0.68   | 1.25   | 6.41   | 16.47  |

See column 4 of Tables 27 and 31, pages 104 and 112.

Q. What were the rates of mortality per thousand for white females at birth and at ages 10, 20, 40, and 60 in 1901 in cities of the original registration states and in the rural part, and what are the differences?—A. Rates of mortality per thousand among white females in 1901

|                        | at birth | age 10 | age 20 | age 40 | age 60 |
|------------------------|----------|--------|--------|--------|--------|
| in cities were         | 125.45   | 2.55   | 5.40   | 10.72  | 31.35  |
| and in rural part were | 89.79    | 2.12   | 5.50   | 7.47   | 20.14  |
| the differences being  | 35.66    | 0.43   | -0.10  | 3.25   | 11.21  |

See column 4 of Tables 29 and 33, pages 108 and 116.

Q. What were the rates of mortality per thousand for white males at birth and at ages 10, 20, 40, and 60 in 1910 in cities of the original registration states and in the rural part, and what are the differences?—A. Rates of mortality per thousand among white males in 1910

|                        | at birth | age 10 | age 20 | age 40 | age 60 |
|------------------------|----------|--------|--------|--------|--------|
| in cities were         | 133.80   | 2.59   | 4.93   | 12.10  | 38.51  |
| and in rural part were | 103.26   | 2.07   | 4.83   | 7.06   | 22.91  |
| the differences being  | 30.54    | 0.52   | 0.10   | 5.04   | 15.60  |

See column 4 of Tables 28 and 32, pages 106 and 114.

Q. What were the rates of mortality per thousand for white females at birth and at ages 10, 20, 40, and 60 in 1910 in cities of the original registration states and in the rural part, and what are the differences?—A. Rates of mortality per thousand among white females in 1910

|                        | at birth | age 10 | age 20 | age 40 | age 60 |
|------------------------|----------|--------|--------|--------|--------|
| in cities were         | 111.23   | 2.23   | 4.10   | 8.83   | 30.65  |
| and in rural part were | 84.97    | 1.80   | 4.41   | 6.65   | 20.06  |
| the differences being  | 26.26    | 0.43   | -0.31  | 2.18   | 10.59  |

See column 4 of Tables 30 and 34, pages 110 and 118.

150822°—21—3

Q. Were the differences between the rates of mortality for persons residing in the cities and in the rural parts greater or less in 1910 than in 1901?—A. Less; compare the differences in the answers to the four preceding questions.

Q. Is the rate of mortality higher in the urban or rural part of the original registration states?—A. Turning to Graph 7 on page 249, showing the rates of mortality among whites in cities and in rural part of the original registration states in 1910, it will be noted that the ——— line, city males, and the ——— line, city females, are generally above and far above the ——— line, rural males, and the ——— line, rural females, respectively.

#### SIGNIFICANT IRREGULARITIES IN RATES OF MORTALITY.

36. Q. At what ages are the exceptions to the rule given in the preceding question and answer?—A. Around age 20 the ——— line approaches very near the ——— line and between ages 17 and 25 the ——— line rises above the ——— line. See Graph 7, page 249.

Q. In thus approaching and crossing one another which curves appear to be irregular?—A. Those in the rural part of the original registration states, for their curves rise very rapidly between ages 15 and 22, then scarcely increase at all for the next 10 years; the ——— line, rural males, slopes down between ages 22 and 26.

Q. Do any other tables show this apparent irregularity?—A. Practically all those for males show an irregularity something like this somewhere between the ages 10 and 35. It is also seen in some tables for females, the most striking examples of which are those for females in the rural part of the original registration states in Graph 5, page 247; those for Negro females in Graph 3, page 245; and those for females in Italy, line ———, and Sweden, line ———, in Graph 9 on page 251. See fourth question in section 39.

Q. What life tables for males exhibit this irregularity only in a small degree?—A. Those for England, line ———, and Australia, line ———, in Graph 8, page 250.

Q. What causes this irregularity?—A. Possibly much of it may be due to tuberculosis, which is peculiarly fatal in youth and early adult life.

#### MORTALITY LOWER AMONG WOMEN THAN AMONG MEN.

37. Q. Which rates of mortality are generally lower, those for males or females?—A. Column 4 in most of the life tables and the corresponding graphs show the rates of mortality to be lower for females for practically the entire range of life.

This can easily be verified by comparing the ——— lines, males, 1910, with the ——— lines, females, 1910, and the ——— lines, males, 1901, with the ——— lines, females, 1901, of Graphs 2 to 5 and 10 on pages 244 to 247 and 252. On

this last page the ..... line and the ----- line, males and females in 1890, respectively, may also be compared. Also by noting corresponding curves in Graphs 8 and 9 on pages 250 and 251 the rates of mortality for males and females in foreign countries during the period 1901-1910 may be compared.

Q. Where do the exceptions to the rule stated in the preceding question and answer occur?—A. Generally between ages 10 and 45. This is well illustrated in Graph 5, page 247, by white males, -----, and white females, -----, in rural districts of the original registration states in 1901. Among Negroes of the original registration states, 1901, Graph 3 on page 245, and in Massachusetts, 1890, Graph 10 on page 252, the curves for the rate of mortality among females are above those among males between ages 1 and 20.

#### VARIATION OF RATES OF MORTALITY WITH AGE.

38. Q. At what period in life do the rates of mortality change the least?—A. Generally between 20 and 40, but in tables which do not show the irregularity mentioned in the third question of section 36 this slow change in the rate of mortality is from about age 10 to age 40. See white females, 1910, line -----, in Graph 6 on page 248; white females in cities, 1910, line -----, Graph 4 on page 246; males and females, 1901-1910, in Australia, line -----, and in England, line -----, in Graphs 8 and 9, pages 250 and 251.

Q. At what age does the rate of mortality change most rapidly?—A. During the first few days of life. This can be seen from Diagram D of Graphs 2 to 7, pages 244 to 249.

#### COMPARISON OF MORTALITY AMONG WHITES AND NEGROES.

39. Q. How do the rates of mortality among Negroes compare with those among white people?—A. The curves representing the rates of mortality among Negroes in 1910 are almost twice as high in Graph 6 on page 248 as those among white people, and they are much more irregular. The greater irregularity in the curves for Negroes is probably partly due to the fact that the tables for white people are based upon a population over fifty times as large as that upon which the Negro tables are based and upon over thirty times as many deaths. See population and mortality statistics upon which the life tables are based at the top of Tables 9, 12, 15, and 18, pages 68, 74, 80, and 86.

Q. Is the general outline of the curves of rates of mortality among Negroes the same as among whites?—A. The curves in Graph 6, page 248, show that the general outline is the same in both cases, but in Diagrams A, B, and D the curves for Negroes are much higher than those for whites, while in Diagram C after age 80 they are lower than those for whites.

Q. Why are the curves of rates of mortality among Negroes lower than those among whites after age 80?—A. This is due in part to the fact that 116 years was

assumed to be the limit of life for both whites and Negroes. See last paragraph in section 31, page 31.

Q. Do the curves for rates of mortality among Negroes show the irregularity mentioned in the third question of section 36 in a greater or less degree than do those for the whites?—A. In a greater degree than those for the aggregate whites, according to Graph 6, page 248, but about the same as do those for whites in the rural part of the original registration states, according to Graphs 3 and 5, pages 245 and 247. However, this period of irregularity begins earlier and is ended by age 27 in the case of the curves for Negroes.

Q. Is the rate of mortality among Negroes in the original registration states increasing or decreasing?—A. Graph 3 on page 245 shows that between 1901 and 1910 there was a marked decrease in the rates of mortality from birth to between ages 20 and 30, but after that age there was a marked increase.

#### CHANGES IN RATES OF MORTALITY IN 1890-1901 COMPARED WITH THOSE IN 1901-1910.

40. Q. Was the change in the rate of mortality as great between 1890 and 1901 as between 1901 and 1910?—A. Death statistics of 1890 are believed to be as reliable for Massachusetts as for any part of the United States. Accordingly, the six curves for Massachusetts are plotted in Graph 10 on page 252. In Diagrams A and B, to between ages 45 and 50, the ----- and ----- lines, males and females in 1890, respectively, are farther above the ----- and ----- lines, males and females in 1901, respectively, than the latter are above the ----- and the ----- lines, males and females in 1910, respectively. However, in Diagram C they are below the other curves for the same sex until old age. Thus it would seem that the change in the rate of mortality between 1890 and 1901, if Massachusetts be considered a fair sample, was even a greater decrease than between 1901 and 1910 up to about age 50, and after that there was an increase, just as between 1901 and 1910.

Q. Are there any populations that show as high rates of mortality in 1910 as Massachusetts did in 1890?—A. Except the life tables for Negroes, none of the life tables in the United States, either in 1901 or in 1910, show as high rates of mortality as do the life tables for Massachusetts in 1890.

#### RATES OF MORTALITY IN UNITED STATES COMPARED WITH THOSE IN OTHER COUNTRIES.

41. Q. What other countries have published life tables?—A. Australia, Japan, and most of the countries of Europe have published life tables.

Q. Are there any for a period of time corresponding to the United States Life Tables for 1910?—A. English Life Tables No. 8.

Q. For what period are most of the recent life tables made?—A. 1901 to 1910. Hence, life tables for the white population in the original registration states, male and female, separately, were constructed for the period

1901-1910, and their rates of mortality, the ——— lines, are plotted together with those for six foreign countries in Graphs 8 and 9 on pages 250 and 251.

Q. What are these six foreign countries?—A. In Graphs 8 and 9 the rates of mortality for males and females, respectively, of four European countries are shown: England, line ———; Germany, line ———; Italy, line ———; and Sweden, line ———. These represent roughly western, central, southern, and northern Europe. There is no published life table for France for this period. There are also graphs for Australia, line ———, and India, line ———.

Q. Which of these seven countries has the highest rate of mortality?—A. India, both for males, Graph 8, and for females, Graph 9, pages 250 and 251.

Q. Which of these countries has the lowest rate of mortality?—A. From shortly after birth to between ages 35 and 40, Australia, line ———, is lowest in both Graphs 8 and 9 except between ages 20 and 35 on Graph 9, where England, line ———, is lowest. Then from between ages 35 and 40 to between 80 and 85 Sweden, line ———, is lowest, both for males and for females.

Q. How do the rates of mortality among *white males* in the original registration states compare with those among males in the six foreign countries?—A. In Graph 8, page 250, the ——— line, white males in the original registration states, is third from the bottom from birth through age 7; after that it rises more rapidly than the other curves, and from age 27 to about age 47 it is much higher than the others, except that for India. From age 47 through age 67 it is some distance beneath the curves for Germany, line ———, and England, line ———, after which it rises less rapidly than other curves and gradually sinks beneath them.

Q. How do the rates of mortality among *white females* in the original registration states compare with those among females in the six foreign countries?—A. In Graph 9, page 251, the ——— line, white females in the original registration states, is third from the bottom from birth through age 13, after which it rises rapidly, so that by age 25 it is above all but Italy, line ———, and India, line ———. After age 40 it is above all save India, although it practically coincides with the curve for England, line ———, from age 50 through age 62. From age 62 it rises less rapidly than the others and becomes the lowest curve after age 92.

Q. What is the most noticeable difference in the rates of mortality of whites in the original registration states and those in the foreign countries?—A. The rate of mortality among whites in the original registration states is less favorable than that of most of the foreign countries from age 20 to between ages 60 and 70. See the two preceding questions and answers.

Q. What class in this country approaches most nearly to the rates of mortality in Australia?—A. White in the rural part of the original registration states in 1910. See Graphs 5, 8, and 9 on pages 247, 250, and 251.

Q. What class in this country approaches most nearly to the rates of mortality in England?—A. White in the original registration states in 1910. See Graphs 6, 8, and 9 on pages 248, 250, and 251.

Q. How do the rates of mortality in India compare with those of Negroes in the original registration states?—A. In Graphs 3, 8, and 9 on pages 245, 250, and 251, it will be seen that the rates of mortality in India, the ——— line, are much higher than those for Negroes.

Q. Apart from the general form of the curve, do the rates of mortality for different countries have other features in common?—A. The lowest value is generally at ages 10 or 11, and in only very rare cases is it outside of ages 9 to 13. Also the annual rate of mortality at birth is repeated in practically all life tables between ages 75 and 85. In most of them it is repeated between the ages 77 and 82. The most notable exceptions to this are in the life tables for Negroes.

#### NUMBER OF SURVIVORS.

##### NUMBER OF SURVIVORS OF A GENERATION OF 100,000 BORN ALIVE.

42. Q. If a generation of 100,000 children born alive lived and died exactly in accordance with the rates of mortality for males in the original registration states in 1910, how many of them would live to attain age 50?—A. In column 2 of Table 4, page 59, the number of this generation surviving to age 50 is seen to be 60,118. The curve of the survivors of this generation, the ——— line in Graph 12, page 254, shows that the number of survivors at age 50 is a little over 60,000.

Q. How closely can the values of these curves of survivors in Graphs 12 to 21, pages 254 to 263, be read?—A. To about one-tenth of the space between the horizontal lines, and this represents 500 survivors.

Q. Between what ages is this generation of 100,000 born alive reduced by one-half?—A. The ——— line in Graph 12, page 254, and column 2 in Table 4, page 58, show that the generation is reduced to 50,000 between ages 58 and 59.

Q. At what ages are the generations of most life tables reduced by one-half?—A. Graphs 12 to 21, pages 254 to 263, Tables 77, 78, and 86, pages 209, 211, and 229, and the columns 2 in Tables 1 to 74 show that the original generation among white races is generally reduced by one-half between ages 55 and 70, and among Negroes between ages 25 and 40, while in India the original generation is reduced by one-half between ages 10 and 13.

Q. Out of 79,116 young white men in the original registration states in 1910 alive at age 20, how many

will be living at age 62?—A. 45,916. See column 2 of Table 9, page 69. In other words, 58.04 per cent will survive to age 62.

Q. Out of 82,275 young white men in the rural part of the original registration states in 1910 alive at age 21, how many will be alive at age 70?—A. 40,897. See column 2 of Table 32, page 115. That is, 49.71 per cent will attain age 70.

Q. Out of 76,741 white men in cities of the original registration states in 1910 aged 21, how many will be alive at age 70?—A. 25,269, or 32.93 per cent, will be alive at age 70. See column 2 of Table 28, page 107.

Q. Out of 60,772 native white men in the original registration states in 1910 aged 50, how many will be alive at age 75?—A. 23,669. See column 2 of Table 20, page 91. Thus, 38.95 per cent will reach age 75.

#### VARIATION OF NUMBER OF SURVIVORS WITH RATE OF MORTALITY.

43. Q. Upon what does the number of survivors at any given age depend?—A. Upon the sum of all the deaths which have occurred in that generation from birth up to the given age. The number of deaths in turn in each age interval depends on the rate of mortality and the number of survivors for that age interval. See first question in section 48.

Q. In Graph 2 it is seen that the rate of mortality among males in the original registration states is higher in 1901 than in 1910 only from birth to age 42. Yet, in Graph 12, page 254, the curve of survivors for males in 1910 remains above that for males in 1901 until age 75. Why is this?—A. At age 42 there are so many more survivors in the male 1910 generation than in the male 1901 generation that it requires 33 years of equal or higher rates of mortality among males in 1910 to make the number of survivors in the two generations equal.

Q. At what time of life does a high rate of mortality have the greatest effect upon the number of survivors?—A. Evidently from the two preceding questions and answers a higher rate of mortality at the younger ages has the greatest effect upon the number of survivors.

#### DIAGRAM OF SURVIVORS UNDER 1 YEAR.

44. Q. At what age does the curve of survivors change most rapidly?—A. During the first year. Diagram A of Graphs 12 to 20, pages 254 to 262, shows that the curve of survivors generally falls from 10,000 to 15,000 during this year. The drop is so abrupt that the lines can not be separated in Diagram A. This separation is shown in Diagram D where mortality statistics by months under 1 year were available.

Q. What increase in scale was necessary to separate the lines as shown in Diagram D of Graphs 12 to 17, pages 254 to 259?—A. The vertical scale in Diagram D is twice that in A and the horizontal scale is sixty times that in A. Even then the curves are not separated during the first few days of life.

Q. When the curves separate in Diagram D of Graph 12, those for 1901 are higher than those for the corresponding sex in 1910 and remain above them to between the ages 4 and 5 months. How does this happen?—A. In Diagram D of Graph 2, showing rates of mortality in the original registration states, page 244, it will be seen that the monthly rate of mortality at birth was lower in 1901 than in 1910. This condition is reversed after the first month, but the effect is shown in the curve of survivors for several months later. See section 43.

Q. At what age has the total number of deaths since birth in the original registration states become twice what they were during the first year of life?—A. Between ages 25 and 30. From Diagram D of Graph 12, page 254, it appears that the number of survivors at the end of the first year of life was between 90,000 and 85,000; in other words, there were between 10,000 and 15,000 deaths during the first year of life. In Diagram A the curves of survivors are from 80,000 to 70,000 between ages 25 to 30, so that the total deaths to that age must have been between 20,000 and 30,000, or twice that during the first year of life.

#### DIAGRAM SHOWING DEVIATION FROM THE MEAN.

45. Q. The curves in Graph 12, page 254, for males in the original registration states in 1910 and 1901, practically coincide after age 75 and those for females after age 85. Are there no differences after these ages?—A. Yes; but the scale of Diagram A is too small to show them. It is not possible in the space available here to separate these curves by drawing them in the regular way, because the drop in the curves between ages 75 and 100 is between 20,000 and 25,000, while the distance between two curves of the same sex is rarely more than 100. Therefore these four curves were transformed *without changing their relative positions* by plotting on a larger vertical scale their respective distances from their mean or average value taken as the BASE LINE in Diagram C, and the distances of the curves from it are called the DEVIATIONS FROM THE MEAN. It will be noted that the 1901 curves are slightly above those for the same sex in 1910.

Q. Does the change in mortality between 1901 and 1910 generally produce no effect upon the curve of survivors at the older ages?—A. Among whites in cities of the original registration states, Graph 14, page 256, it will be seen that the curves do not coincide until after age 95, while among whites in the rural part in Graph 15, page 257, they coincide for a few years around ages 70 and 80, and then the 1901 curves appear on top. This is more strikingly true of the Negroes in the original registration states in Graph 13 on page 255, where the curves cross near ages 55 and 65. In Massachusetts, Graph 20, page 262, the three curves for the same sex in 1890, 1901, and 1910 practically coincide after ages 80 and 85.

Q. Is there any regularity in the curves in Diagram C in Graphs 12 to 17, pages 254 to 259?—A. No, except that in the same division of population those for females are always shown above the BASE LINE, while those for males are below.

#### VARIATIONS IN FORM OF CURVE OF SURVIVORS.

46. Q. Do the curves of survivors differ much in form?—A. Not among white races, but there is a marked difference between the curves for the white and colored races. See Graphs 13 and 16 for Negroes and Graphs 18 and 19 for India, pages 255, 258, 260, and 261.

Q. Is this difference in form of the curves due to the heavy mortality under 5 years among Negroes?—A. No. Comparing the curves for Negro females in 1910, line ----- in Graph 16 on page 258, with those for males in Italy, line -----, and Germany, line -----, in Graph 18 on page 260, it will be noted that the form of all three curves from birth to age 10 is practically the same, but after that age the curve for Negro females in 1910 is almost a straight line. This is true of all the curves for Negroes and those for India.

Q. Among the curves of the six foreign countries in Graphs 18 and 19, pages 260 and 261, are there any which bear resemblance to those for whites in the rural part, Graph 15 on page 257, and those for whites in the original registration states in 1910, Graph 16 on page 258?—A. The curves for Australia, line ———, in Graphs 18 and 19, approach most nearly to those for whites in the rural part of the original registration states, while those for England, line -----, approach most nearly the curves for whites in the original registration states in 1910.

#### NUMBER OF DEATHS.

##### INCIDENCE OF DEATHS IN A GENERATION OF 100,000 BORN ALIVE.

47. Q. If a generation of 100,000 children born alive lived and died in exact accordance with the rates of mortality among males in the original registration states in 1910, how many of them would die in each age interval?—A. The number of deaths in each age interval is shown in column 3 of Table 4 on page 58. See line ——— in Graph 22, page 264.

Q. In which age interval is there the greatest number of deaths?—A. During the first year of life. See Graphs 22 to 31, pages 264 to 273.

Q. What proportion of deaths during the first year of life occurs during the first month of life?—A. From one-third to one-half, generally about two-fifths among white races and about one-third among Negroes. Compare numbers in column 3 for age intervals 0-1 month and 0-1 year in Tables 1 to 36, excluding 23 to 26, and in Tables 38, 40, 43, 46, 48, 50, 52, 54, 56, and 58, which are the only ones showing infant mortality or the first year of life by age intervals of 1 month.

Q. After the first year of life, in what age intervals do the greatest numbers of deaths occur?—A. In age interval 1-2 years among white races, and there is also a maximum number of deaths generally somewhere between ages 67 and 77; among Negroes, in age intervals 1-2, 2-3, and 3-4, and then there is also a maximum number of deaths generally somewhere between ages 55 and 65. See Graphs 22 to 31, pages 264 to 273, and Tables 1 to 74, 79, 80, and 87, pages 52 to 199, 212, 214, and 230.

#### VARIATION OF NUMBER OF DEATHS WITH NUMBER OF SURVIVORS AND RATE OF MORTALITY.

48. Q. Upon what does the number of deaths in any age interval depend?—A. The number of deaths is equal to the product of the number of survivors at the beginning of the age interval and the rate of mortality during the age interval.

Q. What similarity exists between the curves of number of deaths, number of survivors, and rate of mortality?—A. In Graphs 22 to 31, pages 264 to 273, it will be noted that from birth to some age between 50 and 60 curves of the number of deaths bear a strong resemblance to the rate of mortality curves in Graphs 1 to 11, pages 243 to 253, while from some age between 70 and 80 to the end of life these curves bear a marked resemblance to the curves of the number of survivors in Graphs 12 to 21, pages 254 to 263.

Q. Does the apparent irregularity mentioned in section 36, page 33, appear in the curve of the number of deaths?—A. Yes. It is manifested by a decided rise in the curve, usually between ages 15 and 25, sometimes accompanied by a maximum point near age 20. See Graphs 22 to 31, pages 264 to 273.

Q. What is the total number of deaths in column 3 of Tables 1 to 74, pages 52 to 199, and in any column in Tables 79 and 80, pages 212 and 214?—A. 100,000, since all the generation have died by the end of the life table.

Q. How many deaths are there of persons aged 75 years and over in the life table for males in the original registration states in 1910?—A. In column 2 of Table 4, page 59, it will be noted that there are 21,213 survivors at age 75, and as all these die after age 75 the number of deaths of persons aged 75 and over is 21,213. In other words, column 2 represents not only the survivors to each age but also the number of persons who die in current and all older age intervals. See also the last question and answer in section 44.

#### COMPLETE EXPECTATION OF LIFE.

##### COMPLETE EXPECTATION OF LIFE AT BIRTH.

49. Q. If a generation of 100,000 children born alive lived and died in exact accordance with the table of mortality for males in the original registration states in 1910, what would be their average lifetime? In other words, what would be the expectation of life at birth?—A. In Table 4, page 58, at the beginning of column 5, it will be seen that at birth the expectation

of life among males in the original registration states in 1910 was 49.86 years. In other words, the total number of years lived by all these 100,000 children born alive, when divided by 100,000, gives an average lifetime of nearly 50 years. This is also shown on Graph 32, page 274, which shows the expectation of life in the original registration states.

Q. Compared with other populations, is this a long or short average length of life?—A. From Graphs 32 and 34 to 40 on pages 274 and 276 to 282, and in column 5 of Tables 1 to 12, 19 to 22, 27 to 34, 37 to 74, pages 52 to 75, 88 to 95, 104 to 119, and 124 to 199, and in Tables 81 and 82, pages 216 and 218, it will be seen that at birth the expectations of life among white races range from about 40 to 59 years. Hence 49.86 is about the average.

Q. What white populations shown in this volume have the highest and lowest expectations of life at birth?—A. Females in Australia, 1901–1910, had an expectation of life at birth of 58.84 years, while males in New York City in 1901 had an expectation of life at birth of 40.65 years. See line ——— in Graph 39, page 281; column 2 of Table 82, page 218; and column 5 of Table 67, page 184.

#### MAXIMUM EXPECTATION OF LIFE.

50. Q. Is the greatest expectation of life at birth?—A. No. According to Diagrams A and D of Graphs 32 to 40, pages 274 to 282, and column 5 of Tables 1 to 74 (except Tables 23 to 26), pages 52 to 199, and Tables 81 and 82, pages 216 and 218, the maximum value of the expectation of life occurs at or near age 2.

Q. What was the expectation of life at age 2 among males in the original registration states in 1910?—A. The ——— line in Diagram D of Graph 32, page 274, is a little over 56½ years at age 2, and in column 5 of Table 4, page 58, the exact figures are seen to be 56.59 years. In other words, if the sum of all the future years to be lived after age 2 by the children who survive to age 2 in this generation of 100,000 children born alive were divided by the number of survivors at age 2, the quotient would be 56.59.

Q. How does the greatest expectation of life among males in the original registration states in 1910 compare with that of other white races?—A. Diagrams A and D in Graphs 32 and 34 to 40, pages 274 and 276 to 282, and column 5 in Tables 1 to 74 on pages 52 to 199 (except Tables 13 to 18, 23 to 26, 35, and 36), and Tables 81 and 82, pages 216 and 218, show that the greatest expectation of life among white races generally comes to those who survive to age 2 and ranges from about 49 to 63 years. Sometimes the greatest expectation of life is shown for those who survive to age 3, but in those life tables the rates of mortality are generally quite high.

Q. At what age is the expectation of life greatest among Negroes and among the people of India?—

A. At age 3 among Negroes, and among the people of India at age 5. See column 5 of Tables 13 to 18, 35, and 36, pages 76 to 87 and 120 to 123, and line ——— in Graphs 8 and 9, pages 250 and 251.

Q. What is the range of the maximum expectation of life among Negroes and in India according to the tables and graphs just mentioned?—A. 41 to 47 years among Negroes and from 35 to 36 years in India. The graphs for the expectation of life for India, pages 280 and 281, from birth to age 50 were so low that they had to be drawn in Diagram B, and the ages and values for the first half of the graph should be read from the top and the right side, respectively, instead of from the bottom and the left side.

Q. In Graph 33 for Negroes, page 275, why is Diagram B above Diagram A?—A. In order to compare the curves in Diagram A of Graphs 32 to 41 they were not only drawn to the same scale but the limits of the vertical scale of Diagram A are the same in each case, so that the top of any graph is always 62 years and the bottom 16 years according to Diagram A. At the beginning of Diagram A in Graph 33 the curves lie so low on the page that Diagram B could not be drawn beneath it; hence Diagram B was put at the top.

#### VARIATION OF EXPECTATION OF LIFE.

51. Q. What determines the expectation of life at any age?—A. The rate of mortality at that age and all older ages.

Q. What is the range of the increase in expectation of life between birth and ages 2 or 3?—A. Among white races from 4½ to 10 years and among Negroes and the people of India from 10 to 13 years. See Graphs 32 to 40, pages 274 to 282, and column 5 of Tables 1 to 74 (except Tables 23 to 26), pages 52 to 199, and Tables 81 and 82, pages 216 and 218.

Q. Is this increase uniform?—A. No. Diagram D, in the upper right-hand corner of Graphs 32 to 35 and 37, pages 274 to 277 and 279, shows this increase according to months under 1 year of age on a vertical scale the same as in Diagram A, but on a horizontal scale seven times as large. From these diagrams it appears that the greater part of the increase occurs during the first year of life, and about one-third of that occurs during the first month of life.

#### CHANGE IN EXPECTATION OF LIFE BETWEEN 1901 AND 1910.

52. Q. What change in the expectation of life occurred in the original registration states between 1901 and 1910?—A. Graph 32 on page 274 shows that the expectation of life at birth was raised two years among males and two and one-half years among females. Also the 1910 curves remain above those for the same sex in 1901 until about age 30 among the males and age 40 among the females. After that the 1910 curves are lower than those of the same sex in 1901 until old age.

Q. What was the change in the expectation of life between 1901 and 1910 among Negroes of the original registration states?—A. Graph 33 on page 275 shows that the expectation of life was lower among Negro males in 1910 than in 1901 between ages 1 and 75 and among Negro females between ages 8 and 85.

Q. Was the increase in the expectation of life greater in cities or in the rural part of the original registration states between 1901 and 1910?—A. Graphs 34 and 35, pages 276 and 277, show that there was a much greater increase among whites in cities than among whites in the rural part of the original registration states.

Q. In which interval was the increase in expectation of life in Massachusetts greater, between 1890 and 1901 or between 1901 and 1910?—A. Between 1890 and 1901 according to Graph 40 on page 282.

#### COMPARISON OF EXPECTATION OF LIFE IN DIFFERENT CLASSES.

53. Q. Was the expectation of life in 1910 greater in the cities or in the rural part of the original registration states?—A. Graph 37 on page 279 shows that it was much greater in the rural part of the original registration states.

Q. How does the expectation of life among Negroes compare with that among whites?—A. According to Graph 36 on page 278, the expectation of life at birth among Negroes is 16 years less than among whites. After this the curves gradually approach one another, until between ages 75 and 80 in Diagram B the curves for Negroes rise above those for whites. Diagram B had to be divided into two parts, B<sub>1</sub> in the lower left corner and B<sub>2</sub> in the upper right corner, because the curves for Negroes in Diagram A are so low on page 278. See last question and answer in section 50.

Q. How does the expectation of life among whites in the rural part of the original registration states in 1910 compare with those in foreign countries?—A. Graphs 35 and 38, pages 277 and 280, show that the expectation of life among white males, line ———, in the rural part of the original registration states in 1910 between birth and age 5 is very near to that among males in Australia, line ———, and after age 5 it is near to that among males in Sweden, line ———. On the other hand, Graphs 35 and 39, pages 277 and 281, show that the expectation of life among white females, line ———, in the rural part of the original registration states in 1910 between birth and age 20 is near to that among females in Sweden, line ———, but after that age it is very near that of females in Australia, line ———.

Q. How does the expectation of life among whites in the cities of the original registration states in 1910 compare with those in foreign countries?—A. Graphs 34 and 38, pages 276 and 280, show that while the expectation of life at birth among white males, line ———, in cities of the original registration states in 1910 is only a little lower than that among males in

England, line ———, at birth, from that age up to age 65 it is lower and considerably lower than that among males in the foreign countries shown here except India. Graphs 34 and 39, pages 276 and 281, show that while the expectation of life at birth among white females, line ———, in cities of the original registration states in 1910 is only a little lower than that among females in England, line ———, at birth, after that age to age 20 it is only a little above that of Italy, line ———, the lowest among the foreign nations except India; then between ages 20 and 60 it is lower than any of the foreign countries except India.

Q. According to the life tables in this volume, which have the higher expectation of life, males or females?—A. Females. See column 5 in Tables 1 to 74, 81, and 82, pages 52 to 199, 216, and 218 and Graphs 32 to 40, pages 274 to 282.

Q. Is this true even to the older ages?—A. Yes. In Diagram C of Graphs 32, 34, 35, and 37, pages 274, 276, 277, and 279, it will be noted that the graphs for females are generally above the base line, while those for males are generally below. In Diagram C the separation of the curves at the older ages is shown in the same way as in the curves for survivors. See first question and answer in section 45, page 36. The horizontal scale is greatly reduced while the vertical scale is ten times as large as that in Diagram B, except in Graph 34 on page 276, where it is only five times that in Diagram B.

Q. Why is there no Diagram C in Graphs 33 and 36 for Negroes?—A. For Negroes the curves for expectation of life for the same sex in 1901 and 1910 cross at age 75 for males and age 85 for females and are rather widely separated after those ages, and Diagram C is not necessary.

#### STATIONARY POPULATION.

##### ITS PRODUCTION AND THE GENERAL CONDITIONS EXISTING IN IT.

54. Q. If instead of one generation of 100,000 children a new generation of 100,000 children were born alive uniformly throughout each year and lived and died in exact accordance with the rates of mortality among males in the original registration states in 1910, what would be the total number in the stationary population that would ultimately be formed?—A. At the head of column 8 in Table 4, page 58, this total is seen to be 4,986,495.

Q. How many years, or, in other words, how many annual generations of 100,000 births, would be required to form this stationary population of 4,986,495?—A. 107 years, or one generation for each age in the life table.

Q. What would be the annual number of deaths in this stationary population?—A. The number of deaths each year would equal the number of births, or 100,000, since neither the total number nor the number in any age interval in a stationary population would change with time.

Q. In this stationary population how many would survive to each age each year?—A. As many as are shown in each age interval in column 2 of Table 4, page 58, since there would be one generation at each age.

Q. How many years of life would be lived each year by this total stationary population?—A. As many as would be lived by any one of the generations during its entire lifetime.

Q. To how many generations do the annual deaths occurring in any age interval belong?—A. To two successive generations.

Q. What proportion of the annual deaths in any age interval belongs to the older generation and what to the younger one?—A. Except for ages under 5 years and very old ages it is found that the annual deaths in any age interval are about equally divided between the two generations. See sections 107 to 109, pages 339 and 340.

#### AGE DISTRIBUTION OF STATIONARY POPULATION.

55. Q. In the stationary populations of the life tables shown in this volume, what are the numbers living in each age interval?—A. These numbers are shown in column 6 of Tables 1 to 74, pages 52 to 199.

Q. How many in the stationary population for males of the original registration states in 1910 are 75 years of age and over?—A. 143,130, or less than one-thirtieth of the whole population, according to column 8 in Table 4, page 59.

Q. How are the stationary populations among white races divided according to age?—A. An examination of the stationary populations, column 8 of Tables 1 to 74, pages 52 to 199 (except Tables 13 to 18, 35, and 36), shows that one-fourth of the stationary population is under 14 to 17 years of age, and most of them have one-fourth of the population under ages 15 and 16; one-half of the population is under ages 28 to 35 years of age, and most of the tables have one-half the population under ages 32 and 33; three-fourths of the population is under ages 46 to 53, generally under ages 51 and 52.

Q. How are the stationary populations among Negroes divided as to age?—A. One-fourth is under 12 to 13 years of age, one-half is under 24 to 28 years of age, and three-fourths is under 40 to 46 years of age. See column 8 of Tables 13 to 18, 35, and 36, pages 76 to 87, 120, and 122.

Q. In what age intervals do the generations and stationary populations generally end?—A. The life tables for white people end in age intervals 101–102 to 107–108, while those for Negroes end in age intervals 103–104 to 109–110.

#### EXPECTATION OF LIFE AT ANY AGE AND POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.

56. Q. How do the totals of stationary populations vary?—A. Just as do the expectations of life at birth, since the expectation of life at birth equals the total

of the stationary population divided by the number of births, or 100,000 in these life tables.

Q. Why does the expectation of life at birth in Tables 1 to 74, pages 52 to 199, equal the total of the stationary population divided by 100,000?—A. Because the total of the stationary population equals the total number of years lived by any one of the generations of 100,000 born alive. See following question and answer.

Q. Why does the total of the stationary population equal the total number of years lived by any one of the generations of 100,000 born alive?—A. According to the fifth question and answer in section 54, the number of years lived by any one of the generations during its whole lifetime equals the number of years lived each year by the stationary population, and this, of course, equals the total of the stationary population.

Q. How many more years to live have the 22,000 survivors at age 78 among white males in the rural part of the original registration states in 1910?—A. In column 8 of Table 32, page 115, it will be seen that they still have 129,257 years to live, or an average of 5.88 years. See value in column 5 opposite age 78 in Table 32.

#### TOTAL WHITE POPULATION AND TOTAL NEGRO POPULATION COMPARED.

57. Q. What total population would eventually be generated and kept constant or stationary as to numbers by 100,000 annual white male living births distributed uniformly throughout each calendar year if the rates of mortality were those shown in column 4 of Table 9 for white males in the original registration states in 1910?—A. Referring to column 8 of this life table, page 68, it appears that the total population would eventually contain 5,023,371 white males.

Q. What total population would eventually be generated and kept constant or stationary as to numbers by 100,000 annual Negro female births distributed uniformly throughout each calendar year if the rates of mortality were those shown in column 4 of Table 18 for Negro females in the original registration states in 1910?—A. Referring to column 8 of this life table, page 86, it appears that the total population would eventually contain 3,766,879 Negro females.

Comparing this with the preceding question, it appears that although the two populations are generated and maintained constant as to numbers by the same number, 100,000, of annual births, the first would eventually exceed the second by 1,256,492 lives, owing to the difference in mortality rates. To put it in another way, the total stationary Negro female population is only about 75 per cent of the total stationary white male population.

#### MEASURE OF VITALITY.

##### MEANING OF MEASURE OF VITALITY.

58. Q. What is the population per death per year in each yearly age interval for males in the original registration states in 1910?—A. These numbers are

shown for yearly age intervals in column 7 of Table 4 on page 58 and by the line ——— in Graph 42 on page 284.

Q. What is the name given to the ratio defined in column 7?—A. The measure of vitality.

Q. At what age is there the greatest chance to live according to this graph for males in the original registration states in 1910?—A. Age 11. See first question and answer in this section.

Q. Does this agree with the rates of mortality for males in the original registration states in 1910 as shown in column 4 of Table 4 on page 58 and in line ——— of Graph 2 on page 244?—A. Yes.

#### RELATION BETWEEN MEASURE OF VITALITY AND RATE OF MORTALITY.

59. Q. How is the measure of vitality related to the rate of mortality at any age?—A. The measure of vitality is almost the reciprocal of the rate of mortality.

Q. How do these two curves compare?—A. Where one is high, the other is low; where one changes rapidly, the other changes slowly. Hence the measure of vitality curve shows on a much larger scale the variations in the rate of mortality between ages 5 and 40.

Q. How do the scales in Diagram A of Graphs 42 to 51 compare with those of Graphs 1 to 11?—A. The horizontal scale is the same and the vertical scale very nearly the same as in Graph 1, which has practically the same scales as Diagram C in Graphs 2 to 11.

#### MAXIMUM VALUES AND IRREGULARITIES.

60. Q. Among the life tables shown in this volume, which stationary population shows the greatest maximum measure of vitality between ages 9 and 13 and which the least?—A. The greatest maximum measure of vitality is found among females in Australia; at age 10 there is one death each year to every 630.89 living. See line ——— of Graph 49, page 291, and column 2 of Table 84, page 222. The least is found among females in India; at age 12 there is one death each year to every 80 living. See line ——— of Graph 49 and column 8 of Table 84.

Q. Do the apparent irregularities in the rate of mortality, Graphs 2 to 11 on pages 244 to 253, mentioned in section 36, page 33, appear in the measure of vitality, Graphs 42 to 51 on pages 284 to 293?—A. Yes. These irregularities generally begin by an apparently rapid decrease from about age 15 to age 20, and then there follows a very decided slowing up of the decrease for the next 10 or 15 years. Sometimes this slowing up is followed by an increase, as in line ——— of Graph 45, page 287, for white males in the rural part of the original registration states, 1910, and in Graph 43 for Negroes, page 285, and for males in Sweden, line ———, and Italy, line ———, of Graph 48, page 290.

Q. What are the highest and lowest maximum values of the measure of vitality among whites in the United States Life Tables, 1901?—A. Graphs 44, 45, and 47 to 50, pages 286, 287, and 289 to 292, and column 7 of the Tables 1 to 74, pages 52 to 199, which are 1901 life tables, show that the highest maximum value for 1901 is 473.24 among females in Michigan, while the lowest is 318.70 among females in Boston.

Q. What are the highest and lowest maximum values of the measure of vitality among whites in the United States Life Tables, 1910?—A. The highest maximum value of the measure of vitality is 555.13 among white females in the rural part of the original registration states, while the lowest, 389.58, is among females in Boston. See Graphs 44, 45, and 47 to 50, pages 286, 287, and 289 to 292, and column 7 of the Tables 1 to 74, pages 52 to 199, which are 1910 life tables.

#### CHANGES IN MAXIMA.

61. Q. Among white people in the United States, which division experienced the greatest change in the maximum value of the measure of vitality between 1901 and 1910 and which experienced the least?—A. Among males in Philadelphia the increase in this maximum value was from 327.93 in 1901 to 413.29 in 1910, or an increase of over 85, while among males in Michigan the increase was from 403.57 in 1901 to 423.42 in 1910, or an increase of less than 20. See column 7 of Tables 71 and 72, pages 192 to 195, and of Tables 47 and 48, pages 144 to 147.

Q. What were the changes in the maximum values of the measure of vitality in Massachusetts between 1890 and 1901 and between 1901 and 1910?—A. From Graph 50 on page 292 it will be noted that the increase in maximum measure of vitality among males between 1890 and 1901, lines ——— and ———, respectively, was about 120, while among females, lines ——— and ———, respectively, it was about 150. Then between 1901 and 1910 the increase was about 50 among males, lines ——— and ———, and about 80 among females, lines ——— and ———.

Q. What is the range of the maximum measure of vitality among Negroes?—A. Graph 43 on page 285 and column 7 of Tables 13 to 18, 35, and 36, pages 76 to 87, and 120 to 123, show that among Negro females in the original registration states the maximum measure of vitality was 199.11 in 1910 and 129.43 in 1901, both at age 9.

Q. What is the lowest maximum measure of vitality among whites in the original registration states?—A. 261.21 among females in Massachusetts in 1890. See column 7 of Tables 7 to 12, 19 to 34, 37 to 74, pages 64 to 75, 88 to 119, and 124 to 199, and Graphs 44 to 47 and 50, pages 286 to 289 and 292.

Q. What was the increase in the maximum measure of vitality between 1901 and 1910 among Negroes?—

A. Diagram A of Graph 43 on page 285 shows that the increase among females was about 70, while that among males was about 39.

#### MONTHLY MEASURE OF VITALITY.

62. Q. In each monthly age interval what was the stationary population per death per month?—A. These numbers appear in column 7 of the infant mortality section of Tables 1 to 36 (except Tables 23 to 26) and Tables 38, 40, 43, 46, 48, 50, 52, 54, 56, and 58; and Diagram D of Graphs 42 to 47, pages 284 to 289, shows measure of vitality by months under 1 year.

Q. In the age interval from birth to 1 month, what was the stationary population per death per month for white females living in the original registration states in 1910?—A. 25.68. See column 7 of Table 12, page 74.

Q. In the age interval 10–11 months, what was the stationary population per death per month for white males in cities in 1901?—A. 137.04. See column 7 of Table 27, page 104.

Q. How does the measure of vitality in the infant mortality section of the life tables for females compare with that for males?—A. It is higher, that is, more favorable for females. See Diagram D of Graphs 42 to 47, pages 284 to 289.

Q. How does the monthly measure of vitality for infants living in the rural part in 1910 compare with that for urban infants?—A. It is higher for the rural infants. See Diagram D of Graph 47, page 289.

Q. How does the monthly measure of vitality for Negro infants in 1910 compare with that for white infants?—A. The measure of vitality for Negro infants is about one-half that for white infants. See Diagram D of Graph 46, page 288.

Q. How does the monthly measure of vitality for 1910 infants compare with that for 1901 infants?—A. It is more favorable for the 1910 infants. See Diagram D of Graphs 42 to 45, pages 284 to 287.

#### DEATH RATE PER THOUSAND.

##### AVERAGE DEATH RATE OF THE TOTAL POPULATION AT BIRTH.

63. Q. What was the average death rate per thousand in the total male population at birth in the original registration states in 1910?—A. 20.06, according to column 9 of Table 4 on page 58.

Q. What was the range of the average death rate of the totals of other stationary populations among white people in the United States?—A. From 17.44 among white females in the rural part of the original registration states in 1910, Table 34 on page 118, to 24.60 among males in New York City in 1901, Table 67 on page 184, according to column 9 of the various life tables.

Q. Which population whose life table is shown in this volume experienced the greatest decrease in

average death rate at birth between 1901 and 1910, and which the least?—A. Males in New York City changed from 24.60 in 1901, column 9 of Table 67 on page 184, to 22.08 in 1910, column 9 of Table 68 on page 186, a decrease of 2.52 per thousand. Males in the city of Chicago changed from 21.59 in 1901, column 9 of Table 63 on page 176, to 21.78 in 1910, column 9 of Table 64 on page 178, an *increase* of 0.19 per thousand!

Q. Which shows the greater change in the average death rate at birth between 1901 and 1910, the states or the cities?—A. The cities. Among Boston males the change was from 24.02 in 1901, Table 59 on page 168, to 21.72 in 1910, Table 60 on page 170, a decrease of 2.30. Among females, Tables 61 and 62 on pages 172 and 174, there was a decrease of 2.26, while in Massachusetts, which experienced a greater change in average annual death rate at birth than any other state, the decrease was 1.44 for males and 1.38 for females. See column 9 of Tables 42, 43, 45, and 46, pages 134, 136, 140, and 142.

Q. How is the average death rate at any age obtained for a stationary population?—A. By dividing one thousand times the number of annual deaths in current and all older age intervals by the total population living in current and all older age intervals; in other words, by dividing one thousand times the numbers in column 2 by the corresponding ones in column 8. See the second question and answer in section 55, page 40, and the last two questions and answers in section 48, page 37.

##### AVERAGE DEATH RATE IN THE ACTUAL POPULATION.

64. Q. What were the average death rates per thousand in the total *actual* populations upon which the three life tables mentioned in the first two questions and answers in section 62 are based?—A. Referring to the heading of Table 4, page 58, for males in the original registration states in 1910, the estimated population as of July 1, 1910, was 12,177,315. Assuming in this calculation that the number of deaths in 1910 was equal to 195,350, the average of the reported deaths for the three years 1909, 1910, and 1911, the ratio of the deaths to the population, multiplied by 1,000, gives 16.04, which is 4.02 per 1,000 less than that of the stationary population of Table 4.

In the same way the average death rate per thousand in the total *actual* population among white females in the rural part of the original registration states in 1910, Table 34 on page 118, was 13.67, or 3.77 less than in the stationary population, and among males in New York City in 1901, Table 67 on page 184, was 21.18, or 3.42 less than that in the stationary population.

Q. Why does the average annual death rate computed on the actual population and deaths differ from that computed on the population and deaths in the hypothetical stationary population?—A. The rate of mortality at each age is the same in both populations,

but the *distribution of the population in the age intervals* may differ materially. For example, in the actual population there may be an excess of young people, the effect of which would be to decrease the average annual death rate in the total population.

**COMPARISON OF DEATH RATES IN ACTUAL WITH THOSE IN STATIONARY POPULATION.**

65. Q. If two different communities were subject to exactly the same rate of mortality at each age, would the average death rate in the respective stationary populations be the same at each age?—A. Yes, because the average death rates in column 9 are derived from the rates of mortality in column 4. The question is equivalent to the following: If column 4 of the life table for community A were the same as column 4 of the life table for another community B, would column 9 of the life table for community A be the same as column 9 of the life table for community B? The answer is yes.

Q. If two different communities were subject to exactly the same rates of mortality at each age, would the average death rate derived by computing the ratio of the respective reported deaths to enumerated populations be the same for the two communities?—A. Not necessarily, because the distribution of the population in the age intervals might differ greatly. For example, there might be a preponderance of young men in one community and of old men in the other. A large influx by immigration of young men in a community would tend to lower temporarily the average death rate in the total population when computed on the enumerated population and reported deaths. The question is equivalent to the following: If column 4 of the life table for community A were the same as column 4 of the life table for community B, would the computed average death rates be the same in communities A and B if taken directly as the ratio of reported deaths to enumerated populations? The answer is no, not necessarily.

Q. Are there any life tables in this volume whose *stationary* populations have a lower average death rate than the *actual* populations?—A. No.

Q. Was the death rate per thousand of the total *actual* population as much below that of the *stationary* population in 1901 as in 1910?—A. It was lower.

Q. What does this signify?—A. According to the last question and answer in section 62 and to section 63, it would seem that the populations are gradually growing older and are thus approaching the distribution of their stationary populations.

**AVERAGE DEATH RATE FOR SECTIONS OF THE STATIONARY POPULATION.**

66. Q. What is the average death rate per thousand in that portion of the stationary white male population of the original registration states in 1910 between ages 20 and 40?—A. Referring to columns 2 and 8 of Table 9 on page 68 and to the method of making this

calculation explained in section 26 on page 29, the result is:

$$1000 \cdot \frac{(l_{20} - l_{40})}{(T_{20} - T_{40})} = 1000 \cdot \frac{79116 - 68848}{3378969 - 1888606} \\ = \frac{10268000}{1490363} = 6.89.$$

Q. What is the average death rate per thousand in that portion of the stationary Negro female population of the original registration states, 1910, between ages 20 and 40?—A. Referring to columns 2 and 8 of Table 18 on page 86 and to the method of making this calculation explained in section 26 on page 29, the result is:

$$1000 \cdot \frac{(l_{20} - l_{40})}{(T_{20} - T_{40})} = 1000 \cdot \frac{64764 - 50568}{2340453 - 1180253} \\ = \frac{14196000}{1160200} = 12.24.$$

**VARIATION OF AVERAGE DEATH RATE WITH EXPECTATION OF LIFE.**

67. Q. At what age is the average death rate per thousand in a stationary population the lowest?—A. Between ages 2 and 3.

Q. How does this agree with the greatest expectation of life?—A. It agrees exactly. See first and third questions and answers in section 50, page 38.

Q. What relation does the average death rate per thousand bear to the expectation of life at any age?—A. According to section 21 the expectation of life at any age is obtained by dividing the number in column 8 by that in column 2 at that age, while according to section 25 the average death rate per thousand is found by dividing the number in column 2 by the corresponding one in column 8 and multiplying by 1,000. Hence the average death rate per thousand at any age is 1,000 times the reciprocal of the expectation of life at that age.

**CHANGE IN AVERAGE DEATH RATE WITH AGE.**

68. Q. In what other age interval is the average death rate the same as that of the total population or that at birth?—A. Among white people between ages 8 and 17, generally between ages 10 and 12. Among Negroes between ages 17 and 29. See column 9 of Tables 1 to 74, pages 52 to 199 (except Tables 23 to 26), and Graphs 32 to 40, showing the expectation of life, pages 274 to 282. See also section 67.

Q. In what age interval is the average death rate double that of the total population?—A. In Massachusetts, 1890, this occurs in age interval 49–50, but with this exception, among white races this age interval ranges from 41 to 47, the predominating ages being 43 to 45. See Tables 41 and 44, pages 132 and 138, and the tables and graphs mentioned in preceding question and answer. Among Negroes it ranges from 47 to 54. See Tables 13 to 18, 35, and 36, pages 76 to 87 and 120 to 123.

Q. In what age interval is the average death rate three times that of the total population?—A. In Massachusetts, 1890, this occurs in age interval 61–62, but with this exception, among white races this age interval ranges from 54 to 59 and among Negroes from 60 to 65. See column 9 of the tables mentioned in preceding question and answer.

Q. In what age interval is the average death rate ten times that of total population?—A. Among white races this age interval ranges from 78 to 84, with 79 to 82 the predominating ages. Among Negroes this age interval ranges from 89 to 96, and in India it occurs at 83–84. Compare with last question and answer in section 41. See column 9 of tables mentioned in preceding questions and answers.

#### LIFE TABLES OF FOREIGN COUNTRIES.

##### COUNTRIES, PERIODS, GRAPHS, AND FUNCTIONS SHOWN.

69. Q. For what foreign countries are life tables given?—A. For Australia, Denmark, England, France, Germany, Holland, India, Italy, Japan, Norway, Sweden, and Switzerland. See Tables 75 to 84, pages 204 to 223.

Q. Are the life tables of all these countries represented by graphs in this volume?—A. No, only Australia, England, Germany, India, Italy, and Sweden. See Graphs 8, 18, 28, 38, and 48 for males, pages 250, 260, 270, 280, and 290, and Graphs 9, 19, 29, 39, and 49 for females, pages 251, 261, 271, 281, and 291.

Q. For what periods are the foreign life tables calculated?—A. Denmark, for 1906–1910; France and Japan, for 1898–1903; Holland, for 1900–1909; and the others for 1901–1910.

Q. What mortality functions are shown for these 12 foreign countries?—A. The rate of mortality per thousand, number of survivors, number of deaths, complete expectation of life, and measure of vitality. See Tables 75 to 84, pages 204 to 223.

##### RATE OF MORTALITY IN FOREIGN COUNTRIES.

70. Q. What is the lowest rate of mortality in any of these countries?—A. For males, 1.77 per thousand at ages 11 and 12 in Denmark; and for females, 1.59 per thousand at age 10 in Australia. See column 3 of Table 75, page 204, and column 2 of Table 76, page 206.

Q. Which of these countries shows the lowest rate of mortality at birth?—A. Norway, the rate of mortality being 81.45 for males and 66.79 for females. See column 11 of Tables 75 and 76, pages 204 and 206.

Q. How do these rates compare with those in this country?—A. The rate of mortality per thousand at birth for white males in the original registration states for 1901–1910 was 127.38, and the rate for white females was 105.51. See column 14 of Tables 75 and 76, pages 204 and 206.

Q. What is the rate of mortality per thousand at birth among males and females in Japan?—A. 156.86

for males and 140.92 for females. See column 10 of Tables 75 and 76, pages 204 and 206.

Q. Which country shows the most favorable rate of mortality for males at age 50?—A. Norway, the rate being 11.11. See column 11 of Table 75, page 205.

Q. Which country shows the most favorable rate of mortality for females at age 50?—A. Denmark, the rate being 8.97. See column 3 of Table 76, page 207.

Q. Which country after India shows the least favorable rate of mortality from ages 17 to 29 among males?—A. Norway. See Table 75, column 11, page 204.

Q. How do the mortality rates in this country among white males and females in the original registration states compare with those in other countries from age 30 to age 50?—A. Except for France, India, and Japan, they are for the most part less favorable in this country. See Tables 75 and 76, pages 204 and 206.

##### NUMBER OF SURVIVORS OUT OF 100,000 BORN ALIVE.

71. Q. Which country shows the greatest number of survivors at age 21 out of 100,000 births?—A. Australia, with 84,180 males and 86,175 females. See column 2 of Tables 77 and 78, pages 208 and 210.

Q. Which country shows the smallest number of survivors at age 21 out of 100,000 births?—A. India, with 43,091 males and 44,067 females. See column 8 of Tables 77 and 78, pages 208 to 211.

Q. Which country shows the greatest number of survivors at age 70?—A. Norway for males, with 41,911, and Denmark for females, with 47,405 survivors. See column 11 of Table 77 and column 3 of Table 78, pages 208 and 210.

##### NUMBER OF DEATHS OUT OF 100,000 BORN ALIVE.

72. Q. What is the distribution of deaths during the first five years among 100,000 males born alive in Germany?—A. 20,234 under 1 year, 3,181 in the second year of life, 1,143 in the third, 715 in the fourth, and 516 in the fifth. See column 6 of Table 79, page 212.

Q. What are the corresponding figures for Switzerland?—A. 13,840 under 1 year, 1,894 in the second year of life, 824 in the third, 544 in the fourth, and 429 in the fifth. See column 13 of Table 79, page 212.

Q. What country shows the smallest number of deaths during the first year of life in a generation of 100,000 born alive?—A. Norway. Column 11 of Tables 79 and 80, pages 212 and 214, shows that the number of deaths in Norway under 1 year of age among males is 8,145 and among females 6,679.

Q. Is there any country in which more than one-fourth of the children born fail to live 1 year?—A. Yes; in India 28,998 males and 28,460 females die under 1 year of age out of 100,000 of each sex born alive. See column 8 of Tables 79 and 80, pages 212 and 214.

Q. After the first year of life what country shows the smallest number of deaths up to age 9?—A. Denmark, closely followed by Australia. See columns 2 and 3 of Tables 79 and 80, pages 212 and 214.

Q. What country shows the lowest number of deaths during any year of life?—A. Australia, with 140 deaths among females aged 10. See column 2 of Table 80, page 214.

Q. After the second year of life, at what age does the maximum number of deaths occur in a generation of 100,000 born alive among males in France?—A. At age 74, with a maximum of 1,959 deaths. See column 5 of Table 79, page 213.

Q. Between what ages does this maximum number of deaths usually occur?—A. Except for India, between ages 70 and 78 for males and 73 and 77 for females. For India, after age 8, maxima occur at ages 38 and 39, respectively. See Tables 79 and 80, pages 212 and 214.

Q. What country shows the greatest number of deaths out of 100,000 born alive among males aged 20 and 21?—A. Norway; the number of deaths among males aged 20 and 21 in Norway exceeds even that in India.

#### EXPECTATION OF LIFE IN FOREIGN COUNTRIES.

73. Q. What is the maximum expectation of life shown by these tables?—A. For females, 63.20 at ages 1 and 2 in Denmark, and for males, 61.50 at ages 1 and 2 in Denmark. See column 3 of Tables 81 and 82, pages 216 and 218.

Q. What countries show the highest and lowest expectation of life at birth?—A. Australia the highest, 55.20 for males and 58.84 for females; India the lowest, 22.59 for males and 23.31 for females. See columns 2 and 8 of Tables 81 and 82, pages 216 and 218.

Q. What country shows the most favorable expectation of life from about ages 27 and 28 to extreme old age?—A. Norway. See column 11 of Tables 81 and 82, pages 216 and 218.

Q. Do any of the countries show a lower expectation of life for females than for males at the same age?—A. No. See Tables 81 and 82, pages 216 and 218.

#### MEASURE OF VITALITY IN FOREIGN COUNTRIES.

74. Q. At what age is the maximum population per death per year among males in Holland?—A. At age 12, when the population is 496.39 per death per year. See column 7 of Table 83, page 220.

Q. What is the maximum value of the measure of vitality among males in Italy?—A. 457.71 at age 9. See column 9 of Table 83, page 220.

Q. At what age is the measure of vitality among females in England nearest 200?—A. At age 31. See column 4 of Table 84, page 222.

Q. At what age is there one death per annum to each 100 males living in Japan?—A. Age 39. See column 10 in Table 83, page 220.

Q. At what age is there one death per year to each 50 in the female population of the countries shown in Table 84, page 222?—A. Norway and Sweden, between ages 62–63; Denmark, between ages 61–62; Australia, between ages 60–61; Holland, between ages 59–60; Italy, between ages 58–59; France and Germany, between ages 57–58; England, Japan, Switzerland, and the United States, between ages 56–57; India, between ages 24–25.

Q. Which country has the highest measure of vitality and at what age does it occur?—A. Australia, where one death occurs each year to every 630.89 in the female population aged 10. See column 2 of Table 84, page 222. Compare with the first question and answer in section 70, page 44.

#### MORTALITY TABLES OF INSURANCE COMPANIES.

##### TABLES SHOWN AND WHERE THEY ARE USED.

75. Q. What mortality tables derived from the experience of life insurance companies appear in this volume?—A. American Experience, Thirty American Offices, American-Canadian Mortality Investigation, British Offices 1863–1893, Four French Offices, Twenty-three German Offices, Three Japanese Offices, Seventeen Swedish Offices, National Fraternal Congress, and Standard Industrial. See section 90, page 224, and Tables 85 to 91, pages 226 to 239.

Q. What table is employed by most insurance companies in this country to calculate premiums and reserves?—A. The American Experience Mortality Table. See column 2 of Tables 85 to 91, pages 226 to 239.

Q. What table is employed by French insurance companies?—A. The Four French Offices Mortality Experience. See column 6 of Tables 85 to 91, pages 226 to 239.

Q. What table is employed by many fraternal societies in this country?—A. The National Fraternal Congress Table of Mortality. See column 10 of Tables 85 to 91, pages 226 to 239.

Q. What table is employed by most industrial insurance companies in this country?—A. The Standard Industrial Mortality Table. See column 11 of Tables 85 to 91, pages 226 to 239.

Q. What is the most recent mortality investigation among insured lives in this country?—A. The American-Canadian Mortality Investigation; it is based on the experience of insurance companies in this country and Canada on insured lives during the period 1900–1915. See column 4 of Tables 85 to 91, pages 226 to 239.

Q. What is the most recent investigation among insured lives in Great Britain?—A. The British Offices Life Tables, based on the experience of insurance companies in England and Scotland on insured lives during the period 1863–1893. See column 5 of Tables 85 to 91, pages 226 to 239.

## DISTINCTION BETWEEN INSURANCE AND CENSUS TABLES.

76. Q. What is the chief difference between mortality tables derived from the experience of life insurance companies and those derived from census statistics?—A. The former include a larger proportion of healthy lives, because applicants for insurance are subjected to a medical examination before they are accepted as risks by the insurance companies. In the latter case no such distinction is made.

Q. What is the effect upon the rates of mortality derived by excluding those insured lives which had passed a medical examination within five years?—A. The effect is to increase the rates of mortality.

## GRAPHS OF INSURANCE MORTALITY TABLES.

77. Q. What insurance mortality tables are represented by graphs in this volume?—A. American Experience, line -----; American-Canadian Mortality Investigation, AM<sup>(s)</sup>, line .....; National Fraternal Congress, line ———; British Offices, O<sup>(s)</sup>, line -----; and Three Japanese Offices, J<sup>(s)</sup>, line ———, in Graphs 11, 21, 31, 41, and 51 on pages 253, 263, 273, 283, and 293. The graph of the life table for white males in the original registration states, 1910, line ———, is also shown.

Q. What is the meaning of the letter M and the superscripts <sup>M</sup> and <sup>(s)</sup> in the symbolic designation of the American-Canadian, British Offices, and Japanese Offices Tables?—A. M and <sup>M</sup> mean that the table is based on male lives and the superscript <sup>(s)</sup> means that in deriving these tables all insured lives which had been insured less than five years were excluded from consideration.

Q. What mortality functions based on the experience of insurance companies are graphically represented?—A. The rate of mortality per thousand, the number of survivors out of 79,116 living at age 20, the number of deaths out of 79,116 living at age 20, the expectation of life, and the measure of vitality. See Graphs 11, 21, 31, 41, and 51, pages 253, 263, 273, 283, and 293.

Q. Why are the number of survivors and the number of deaths out of 79,116 living at age 20 instead of out of 100,000 born alive used in the insurance mortality tables?—A. See second question and answer in section 79, page 46, and section 91, page 225.

## RATES OF MORTALITY AMONG INSURED LIVES.

78. Q. How do the rates of mortality in the Three Japanese Offices Life Tables compare with those in insurance tables of other countries?—A. For most ages the rates are considerably higher. See column 8 of Table 85, page 226, and line ——— in Graph 11, page 253.

Q. Does the irregularity mentioned in section 36, page 33, appear in the rates of mortality among the insured?—A. Yes. See columns 6, 7, and 8 of Table 85,

page 226. Among French insured there is a maximum of 6.92 per thousand at age 21, this rate being higher than any of the others between ages 5 and 30. Among German insured there is a maximum of 9.34 per thousand at age 19, and this rate is not reached again until between ages 32 and 33. Among Japanese insured there is a maximum of 12.15 per thousand at age 21; the rates do not rise to this point again until between ages 42 and 43.

Q. Among the insured lives in Table 85, page 226, which show the most favorable rates of mortality?—A. Seventeen Swedish Offices, from age 15 to age 33; American-Canadian, from age 34 to age 49; National Fraternal Congress, from age 50 to age 77; Thirty American Offices, from age 78 to age 81; and United States, white males in original registration states, from age 83 to age 100, the American-Canadian having the lowest rate at age 82.

Q. Among the *graphs* for insured lives, which one shows the most favorable rates of mortality?—A. American-Canadian, line ———, in Graph 11 on page 253. This curve is below all the others from age 15 to about age 50. From age 50 to about age 80 it rises slightly above National Fraternal Congress, line ———, after which it is again lower than all the other curves for insured lives up to age 100.

Q. How do the rates of the American Experience Table between ages 15 and 40 compare with those of the other tables?—A. They are higher, except for the Twenty-three German Offices, the Three Japanese Offices between ages 15 and 30, and the Standard Industrial Tables between ages 15 and 22. See Table 85, page 226.

## NUMBER OF SURVIVORS AMONG INSURED LIVES.

79. Q. What does the graph of survivors among insured lives show?—A. It shows the number of survivors by the various tables at each age out of 79,116 alive at age 20. See Graph 21, page 263.

Q. Why was the number of survivors chosen as 79,116 at age 20?—A. The various mortality tables for insured lives, unlike life tables, usually begin at ages 10, 15, or 20. In order to compare the survivors at each age it is necessary to begin with the same number at a common age. The lowest age common to all these tables was 20, and 79,116 was chosen as the common number of lives at age 20 because this is the number of survivors at this age in the life table for white males in the original registration states, 1910.

Q. Are the original tables, showing the number of survivors among insured lives, given?—A. Yes, they appear in Table 90 on page 236.

Q. Are tables given showing the number of survivors among insured lives out of 79,116 living at age 20?—A. Yes, these figures are given in Table 86 on page 228.

Q. At what ages are the numbers of survivors among insured lives and white males in the original registration states in Table 86, page 229, reduced to 50,000?—

A. Standard Industrial, between ages 52-53; Three Japanese Offices, between ages 54-55; Twenty-three German Offices, between ages 55-56; Four French Offices, between ages 58-59; American Experience, British Offices, and United States, white males in the original registration states, 1910, between ages 59-60; Thirty American Offices, between ages 60-61; American-Canadian, Seventeen Swedish Offices, and National Fraternal Congress, between ages 63-64. Compare with Graph 21 on page 263.

#### NUMBER DYING AMONG INSURED LIVES.

80. Q. What table in the *graphs* for insured lives shows the smallest number of deaths between ages 15 and 50?—A. The American-Canadian, line -----, in Graph 31, page 273.

Q. What table among insured lives has a smaller number of deaths than the American-Canadian from age 15 to age 32?—A. The Seventeen Swedish Offices Table. See columns 4 and 9 of Table 87, page 230.

Q. Between what ages does the maximum number of deaths after age 5 occur?—A. Between ages 70 and 76, except among Japanese insured. See Table 87, page 231.

Q. What peculiarity does the Japanese table for insured lives exhibit in the *graph* of number of deaths?—A. The Japanese table shows three maxima at ages 21, 63, and 72, while each of the other tables shows only one maximum point on this curve. See column 8 of Table 87, page 230, and line ----- in Graph 31, page 273.

Q. Are the original tables, showing the number of deaths among insured lives, given?—A. Yes; they appear in Table 91 on page 238.

#### EXPECTATION OF LIFE AMONG INSURED LIVES.

81. Q. What table among the insured lives in Graph 41, page 283, shows the lowest expectation of life?—A. The Three Japanese Offices Table, line -----.

Q. What tables in Graph 41, page 283, show the most favorable expectation of life?—A. The American-Canadian, line -----, and the National Fraternal Congress, line -----.

Q. How do the expectations of life in the American Experience and British Offices  $O^{(5)}$  Tables compare?—A. Lines ----- and -----, respectively, in Graph 41, page 283, are very close together for almost the entire range of life and lie between the American-Canadian, line -----, and the Three Japanese Offices Tables, line -----, between ages 10 and 60.

Q. What is the expectation of life at age 2 by the Standard Industrial Mortality Table?—A. 48.83. See column 11 of Table 88, page 232.

Q. Between what limits in the insurance tables does the expectation of life at age 35 lie?—A. Between about 27 and 34 years. See Table 88, page 232.

Q. What is the expectation of life among insured lives at age 70?—A. Between about 7 and 9 years. See Table 88, page 233.

Q. Which table among insured lives has the highest expectation of life at age 20, and which has the lowest?—A. American-Canadian, in column 4 of Table 88, has an expectation of life at age 20 of 45.93, which is slightly higher than that for the National Fraternal Congress, column 10, and the Seventeen Swedish Offices in column 9. The expectation of life at age 20 in the Standard Industrial Mortality Table, column 11, is 37.50, which is the lowest.

#### MEASURE OF VITALITY AMONG INSURED LIVES.

82. Q. Which of the tables for insured lives shows the lowest measure of vitality after age 30?—A. The Standard Industrial Mortality Table up to age 70, after which the Three Japanese Offices shows the lowest measure of vitality up to age 88. See columns 8 and 11 in Table 89, page 234.

Q. How does the measure of vitality for the British Offices  $O^{(5)}$  Table compare with that for the American Experience Table?—A. Line ----- in Graph 51, page 293, is higher than that for the American Experience Table, line -----, from age 10 to age 40, and lower from age 41 to age 70, after which they practically coincide.

Q. Which table for the insured shows the highest measure of vitality between ages 15 and 33?—A. The Seventeen Swedish Offices Table. See column 9 of Table 89, page 234.

Q. Which table shows the next highest measure of vitality from ages 15 to 33?—A. The American-Canadian. See column 4 of Table 89, page 234, and line ----- in Graph 51, page 293.

Q. Does the irregularity mentioned in the second question and answer in section 59, page 41, appear in the graphs for measure of vitality of insured lives?—A. Yes; it is most pronounced in the Three Japanese Offices Table, line -----, and the American-Canadian Mortality Investigation, line -----, in Graph 51 on page 293.

#### PARTS V TO VIII.

##### LIFE ANNUITIES, PREMIUMS, AND COMMUTATION COLUMNS.

83. Q. For what United States life tables are values of life annuities given in this volume?—A. For white *males* in the original registration states, 1910, and white *females* in the original registration states, 1910. See Tables 92 and 99, respectively, pages 298 and 312.

Q. At what rates of interest are these annuities calculated?—A. 3,  $3\frac{1}{2}$ , 4, 5, and 6 per cent.

Q. What are the payments of these annuities, when are they made, and how long do they continue?—A. The payments are \$1 a year, payable at the *beginning* of each age interval, and continue throughout life.

Q. What is the designation of an annuity of this kind and what is its symbol?—A. It is called a life annuity due, and its symbol is  $a_x$ . See Tables 92 and 99, pages 298 and 312.

Q. What is the present value at 4 per cent of a life annuity of \$100 per annum to a white male now aged 21, first payment to be made at once?—A. Referring to the 4 per cent column at age 21 in Table 92 on page 298, it appears that the present value of a similar annuity of \$1 a year is \$19.7245. Therefore, by proportion, the present value of an annuity of \$100 per annum is \$1,972.45.

Q. What is the present value of a similar annuity to a white female aged 21?—A. Turning to Table 99 on page 312 and referring to age 21 under the 4 per cent column, it is seen that the value of a life annuity of \$100 per annum, first payment to be made at once, is \$2,018.60.

Q. What is the present value at 6 per cent of a life annuity of \$1,000 to a white man now aged 70, first payment to be made after a year when he is 71?—A. Consulting Table 92 on page 299 in the age 70 row and the 6 per cent column, it is seen that the value of the annuity, if the first payment were made at once, would be \$6,821.20. Deducting \$1,000, since the first payment is not made at once, the present value of the required annuity is found to be \$5,821.20.

Q. What is the value of a similar life annuity to a white woman aged 70?—A. \$6,113.40. See Table 99, page 313.

Q. What tables of net premiums are shown in this volume?—A. Tables of single net premiums and annual net premiums at each age for a whole life insurance of \$1,000. Net premiums are calculated at 3, 3½, and 4 per cent, those for white males in the original registration states, 1910, being given in Table 93 on pages 300 and 301, and those for white females in the original registration states, 1910, in Table 100 on pages 314 and 315.

Q. What commutation columns appear in this volume?—A. Commutation columns for the functions  $D_x$ ,  $N_x$ ,  $S_x$ ,  $C_x$ ,  $M_x$ , and  $R_x$  are given for 3, 3½, 4, 5, and 6 per cent. Those for white males are given in Tables 94 to 98, pages 302 to 311, and those for white females in Tables 101 to 105, pages 316 to 325.

Q. Upon what life tables are these commutation columns based?—A. Those in Tables 94 to 98, pages 302 to 311, are based upon the life table for white males in the original registration states, 1910, and those in Tables 101 to 105, pages 316 to 325, on the life table for white females in the original registration states, 1910.

Q. What is the purpose of these commutation columns?—A. They are to assist the actuary in making calculations based upon life contingencies in ac-

cordance with mortality experience among white males and white females in this country.

#### MATHEMATICAL THEORY OF CONSTRUCTION OF LIFE TABLES.

84. Q. Are the mathematical formulas used in the construction of the United States Life Tables explained in this text?—A. Yes, they are explained and demonstrated in Part VI, pages 327 to 365.

Q. Were the same formulas applied to construct the life tables for the entire range of life?—A. No; there were three main divisions in each life table to which different formulas and processes were applied. See section 95, page 329.

Q. What were these divisions?—A. The first division includes the early years of life, ranging from birth to about age 5; the second or middle division runs from about age 5 to about age 85; the third division from about age 85 to age 115.

Q. In the construction of these life tables was any assumption made as to the age limit of human life?—A. Yes, the age limit of human life was assumed to be 116 years.

Q. What formulas were applied to calculate the rates of mortality for the early years of life?—A. These formulas are explained and demonstrated in sections 106 to 112 on pages 338 to 343.

Q. What formulas were applied to obtain the rates for the middle range of life?—A. The osculatory fifth difference formula was employed for this range; the formulas and methods are given in sections 113 to 116 on pages 344 to 347.

Q. What formulas were employed in constructing the rates at the older ages?—A. A modification of Wittstein's formula and Spencer's 21-term formula; they are explained in sections 117 to 122, pages 348 to 350.

Q. Were these the only formulas employed?—A. No; many other formulas and processes were devised to meet the varying problems presented in the reduction of the original statistics. The details are fully described in Part VI.

Q. Is Part VI of the text designed for the average reader?—A. No; it is written for the information of actuaries and mathematicians.

#### DESCRIPTION OF CALCULATION OF ONE LIFE TABLE AND TABULAR OUTLINE FOR CONSTRUCTION OF EACH LIFE TABLE.

85. Q. Of what does Part VII in this text consist?—A. It consists of a detailed description of the actual processes used in the calculation of the life table for

males in the state of New York, 1910, accompanied by photographs of graphs, diagrams, and adding machine tapes used in connection with the numerical computations, and followed by a tabular outline of the extra information needed to construct each of the life tables.

Q. What is the purpose of this section of the text?—

A. It is intended to guide and assist students and others who desire to reproduce these life tables from the original statistics or to construct other life tables in a similar manner.

Q. What plan has been adopted in the explanation in Part VII?—A. The construction of the entire life table has been broken up into natural divisions. Each of these divisions is given a section number in the descriptive text on pages 369 to 414, and the photograph of the corresponding numerical computation is given a tape number which is the same as the number of the section in the text in which the computation is described. The tape is referred to in the text by this number, and the corresponding section of the text is readily located from the tape number at the head of the computation. The photographs are interleaved with the descriptive text in such manner as to bring each tape and its corresponding section as near together as possible.

Q. Is there a description of the construction of any other life table in the text?—A. No; but Table 135 on pages 416 to 419 gives the extra information needed to construct each of the United States Life Tables in addition to that already given in the description of the calculation of one life table.

#### THE ORIGINAL STATISTICS.

86. Q. Are the original statistics upon which the United States Life Tables are based given?—A. Yes, they are given in Part VIII, pages 421 to 476.

150822°—21—4

Q. Of what do the original statistics consist?—A. Enumerated populations, estimates of populations, reported deaths, and birth registration statistics.

Q. In what form are they presented?—A. All the original statistics used in the construction of an individual life table are brought together on a single page. In some cases the original statistics for two or more life tables are given on one page.

Q. Are the original statistics for all the life tables uniform in character?—A. No, they are not. There are seven types, which are described in section 275, page 423.

Q. Were the registered births used in the construction of all the life tables?—A. No, only for twelve tables, Massachusetts and Boston for 1901 and 1910 and the cities of New York and Philadelphia for 1910.

Q. How was the number of births obtained for each of the other life tables?—A. The number of births was computed from the populations and deaths under 5 years. Table 136, page 425, shows the computed number of births, the number of births registered, and the difference between the two.

Q. Why was the computed number of births used instead of the number of births registered?—A. Because the birth registration statistics were too unreliable in most cases; the numbers were usually much too small.

Q. Are the reported deaths under age 5 given which were used in determining the number of births?—A. Yes, at the bottom of each page of the original statistics upon which the life tables are based, except where the registered births were used in determining the rates of mortality.

Q. Is the process of deriving the number of births from population and death statistics shown?—A. Yes, in sections 137 to 142, pages 370 and 371, and in the tapes to which they refer.

## ORIGINAL REGISTRATION STATES: 1901.

TABLE 1

REPORTED DEATHS IN 1900 (343,217), IN 1901 (332,203), AND IN 1902 (318,636).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 PERSONS BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Persons were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                  | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |

## ORIGINAL REGISTRATION STATES: 1910.

TABLE 6

REPORTED DEATHS IN 1909 (165,379), IN 1910 (175,842), AND IN 1911 (171,406).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | Of 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |

## ORIGINAL REGISTRATION STATES: 1901.

TABLE 7

REPORTED DEATHS IN 1900 (173,731), IN 1901 (169,530), AND IN 1902 (163,387).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

## ORIGINAL REGISTRATION STATES: 1910.

## TABLE 9

REPORTED DEATHS IN 1909 (182,373), IN 1910 (194,791), AND IN 1911 (190,497).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

## ORIGINAL REGISTRATION STATES: 1901.

## TABLE 10

REPORTED DEATHS IN 1900 (159,079), IN 1901 (152,418), AND IN 1902 (145,163).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

## ORIGINAL REGISTRATION STATES: 1901 TO 1910.

## TABLE 11

REPORTED DEATHS IN 1901 (152,418), IN 1902 (145,163), IN 1903 (149,516), IN 1904 (159,338), IN 1905 (157,239), IN 1906 (160,227), AND IN 1910 (170,233).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |

## ORIGINAL REGISTRATION STATES: 1910.

TABLE 12

REPORTED DEATHS IN 1909 (160,227), IN 1910 (170,233), AND IN 1911 (165,918).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000/L_x$                                                                                   |

## ORIGINAL REGISTRATION STATES: 1901.

## TABLE 13

REPORTED DEATHS IN 1900 (4,972), IN 1901 (5,030), AND IN 1902 (4,986).

Michigan and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE<br>INTERVAL. | OF 100,000 MALES BORN<br>ALIVE:                     |                                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND. | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                           | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                                                |                                                            |                                                                               |

## ORIGINAL REGISTRATION STATES: 1901 TO 1910.

TABLE 14

REPORTED DEATHS IN 1901 (5,030), IN 1902 (4,986), IN 1903 (5,231), IN 1904 (5,729), IN 1905 (5,700), IN 1906 (5,734), IN 1909 (5,531), AND IN 1910 (6,052).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                     | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                   | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                   | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                       | 7                                     | 8                                                                  | 9                                                                                            |

## ORIGINAL REGISTRATION STATES: 1901.

## TABLE 16

REPORTED DEATHS IN 1900 (4,982), IN 1901 (4,804), AND IN 1902 (4,732).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 19.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

## ORIGINAL REGISTRATION STATES: 1910.

## TABLE 18

REPORTED DEATHS IN 1909 (5,025), IN 1910 (5,481), AND IN 1911 (5,347).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

## THE ORIGINAL REGISTRATION STATES: 1901.

## TABLE 19

REPORTED DEATHS IN 1900 (129,797), IN 1901 (124,250), AND IN 1902 (120,134).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE ORIGINAL REGISTRATION STATES: 1910.

## TABLE 20

REPORTED DEATHS IN 1909 (132,091), IN 1910 (140,845), AND IN 1911 (135,722).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE ORIGINAL REGISTRATION STATES: 1901.

## TABLE 21

REPORTED DEATHS IN 1900 (118,340), IN 1901 (111,495), AND IN 1902 (107,132).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 FEMALES BORN<br>ALIVE:                |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## THE ORIGINAL REGISTRATION STATES: 1910.

## TABLE 22

REPORTED DEATHS IN 1909 (116,471), IN 1910 (123,551), AND IN 1911 (119,064).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000L_x/T_x$                                                                                |

| 11-12                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                            |                               |                                                                              |                                                                                  |                                                                                                                                                                                                             |                                       |                                                                    |                                                                                              |
| There are two important reasons for beginning the life tables for foreign-born whites at age 5: First, the proportion of children under 5 years of age among foreign-born whites is so much smaller than among other classes of the population that mortality rates deduced therefrom are not reliable; second, the deaths among whites of unknown nativity must be distributed among deaths of native whites and foreign-born whites, and any error in the choice of the method of distribution would materially affect mortality rates under 5 years of age among the foreign-born whites. |                                            |                               |                                                                              |                                                                                  |                                                                                                                                                                                                             |                                       |                                                                    |                                                                                              |
| LIFE TABLE FOR WHOLE RANGE OF LIFE BY AGE INTERVALS OF ONE YEAR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                            |                               |                                                                              |                                                                                  |                                                                                                                                                                                                             |                                       |                                                                    |                                                                                              |

## IN THE ORIGINAL REGISTRATION STATES: 1901.

## TABLE 23

REPORTED DEATHS IN 1900 (43,934), IN 1901 (45,280), AND IN 1902 (43,253).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES ALIVE AT EXACT AGE 5:     |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males at Age 5 were Added Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

## IN THE ORIGINAL REGISTRATION STATES: 1910.

## TABLE 24

REPORTED DEATHS IN 1909 (50,282), IN 1910 (53,946), AND IN 1911 (54,775).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 MALES ALIVE AT EXACT AGE 5:     |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males at Age 5 were Added Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

| 8-9                                                                |  |  |               |           |  |            |  |              |
| 9-10                                                               |  |  |               |           |  |            |  |              |
| 10-11                                                              |  |  |               |           |  |            |  |              |
| 11-12                                                              |  |  |               |           |  |            |  |              |

There are two important reasons for beginning the life tables for foreign-born whites at age 5: First, the proportion of children under 5 years of age among foreign-born whites is so much smaller than among other classes of the population that mortality rates deduced therefrom are not reliable; second, the deaths among whites of unknown nativity must be distributed among deaths of native whites and foreign-born whites, and any error in the choice of the method of distribution would materially affect mortality rates under 5 years of age among the foreign-born whites.

| LIFE TABLE FOR WHOLE RANGE OF LIFE BY AGE INTERVALS OF ONE YEAR. |         |     |              |           |        |           |           |              |
|------------------------------------------------------------------|---------|-----|--------------|-----------|--------|-----------|-----------|--------------|
| Years.                                                           |         |     | Annual rate. | In years. |        | Per year. |           | Annual rate. |
| 0-1                                                              |         |     |              |           |        |           |           |              |
| 1-2                                                              |         |     |              |           |        |           |           |              |
| 2-3                                                              |         |     |              |           |        |           |           |              |
| 3-4                                                              |         |     |              |           |        |           |           |              |

## IN THE ORIGINAL REGISTRATION STATES: 1901.

## TABLE 25

REPORTED DEATHS IN 1900 (40,739), IN 1901 (40,923), AND IN 1902 (38,031).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES ALIVE AT EXACT AGE 5:   |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females at Age 5 were Added Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                             | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                           | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                           | $L_x/d_x$                             | $T_x$                                                              | $1000l_x/T_x$                                                                                |

| 8-9                                                                |  |  |               |           |  |            |  |              |
| 9-10                                                               |  |  |               |           |  |            |  |              |
| 10-11                                                              |  |  |               |           |  |            |  |              |
| 11-12                                                              |  |  |               |           |  |            |  |              |

There are two important reasons for beginning the life tables for foreign-born whites at age 5: First, the proportion of children under 5 years of age among foreign-born whites is so much smaller than among other classes of the population that mortality rates deduced therefrom are not reliable; second, the deaths among whites of unknown nativity must be distributed among deaths of native whites and foreign-born whites, and any error in the choice of the method of distribution would materially affect mortality rates under 5 years of age among the foreign-born whites.

## IN THE ORIGINAL REGISTRATION STATES: 1910.

TABLE 26

REPORTED DEATHS IN 1909 (43,756), IN 1910 (46,682), AND IN 1911 (46,854).

Michigan, and the District of Columbia. An explanation of each column of the life tables is given on pages 25 to 29, and illustrative examples, showing how to use the pages 29 to 49.

| AGE<br>INTERVAL.                                    | OF 100,000 FEMALES ALIVE<br>AT EXACT AGE 5:      |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Females at Age 5 were Added Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |

## UNITED STATES LIFE TABLES.

TABLE 27

## LIFE TABLE FOR WHITE MALES IN CITIES OF

BASED ON THE ESTIMATED POPULATION JULY 1, 1901 (5,314,456), AND ON THE

NOTE.—The original registration states include Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, Illinois in 1910 for the years 1910 and 1911. An explanation of each column of the life tables is given on

| AGE INTERVAL.                              | OF 100,000 MALES BORN ALIVE:               |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                     | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                   | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                   | $L_x/d_x$                             | $T_x$                                                              | $1000l_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                       | 7                                     | 8                                                                  | 9                                                                                            |

## THE ORIGINAL REGISTRATION STATES: 1901.

## TABLE 27

REPORTED DEATHS IN 1900 (101,480), IN 1901 (100,967), AND IN 1902 (99,631).

Michigan, and the District of Columbia. The term "cities" means municipalities of 8,000 or more inhabitants in 1900 for the year 1900, and of 10,000 or more inhabitants in 1901 and 1902. Illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE<br>INTERVAL. | Of 100,000 MALES BORN<br>ALIVE:                     |                                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND. | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                           | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                                                |                                                            |                                                                               |

TABLE 29

## LIFE TABLE FOR WHITE FEMALES IN CITIES

BASED ON THE ESTIMATED POPULATION JULY 1, 1901 (5,488,482), AND ON THE

NOTE.—The original registration states include Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, Illinois in 1910 for the years 1910 and 1911. An explanation of each column of the life tables is given

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION, Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

## OF THE ORIGINAL REGISTRATION STATES: 1901.

## TABLE 29

REPORTED DEATHS IN 1900 (92,443), IN 1901 (90,330), AND IN 1902 (88,025).

Michigan, and the District of Columbia. The term "cities" means municipalities of 8,000 or more inhabitants in 1900 for the year 1900, and of 10,000 or more inhabitants on pages 25 to 29, and illustrative examples, showing how to use the tables, are given on pages 29 to 40.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |

TABLE 30

## LIFE TABLE FOR WHITE FEMALES IN CITIES

BASED ON THE ESTIMATED POPULATION JULY 1, 1910 (7,246,306), AND ON THE

NOTE.—The original registration states include Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Indiana, Illinois, and Ohio for the years 1910 and 1911. An explanation of each column of the life tables is given

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |
| $x$ to $x+1$                               | $l_x$                                      | $d_x$                         | $1000q_x$                                                                    | $e_x$                                                                            | $L_x$                                                                                                                                                                                                       | $L_x/d_x$                             | $T_x$                                                              | $1000l_x/T_x$                                                                                |
| 1                                          | 2                                          | 3                             | 4                                                                            | 5                                                                                | 6                                                                                                                                                                                                           | 7                                     | 8                                                                  | 9                                                                                            |

## OF THE ORIGINAL REGISTRATION STATES: 1910.

## TABLE 30

REPORTED DEATHS IN 1909 (101,088), IN 1910 (107,757), AND IN 1911 (104,586).

Michigan, and the District of Columbia. The term "cities" means municipalities of 8,000 or more inhabitants in 1900 for the year 1909, and of 10,000 or more inhabitants on pages 25 to 29, and illustrative examples, showing how to use the tables, are given on pages 29 to 49.

| AGE INTERVAL.                              | OF 100,000 FEMALES BORN ALIVE:             |                               | RATE OF MORTALITY PER THOUSAND.                                              | COMPLETE EXPECTATION OF LIFE.                                                    | STATIONARY FEMALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4, would result if 100,000 Females were Born Alive Uniformly Throughout Each Year. |                                       |                                                                    |                                                                                              |
|--------------------------------------------|--------------------------------------------|-------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|                                            |                                            |                               |                                                                              |                                                                                  | POPULATION IN CURRENT AGE INTERVAL.                                                                                                                                                                         | MEASURE OF VITALITY.                  | POPULATION IN CURRENT AND ALL OLDER AGE INTERVALS.                 | DEATH RATE PER THOUSAND.                                                                     |
| Period of lifetime between two exact ages. | Number alive at beginning of age interval. | Number dying in age interval. | Number dying in age interval among 1,000 alive at beginning of age interval. | Average length of life remaining to each one alive at beginning of age interval. | Including only those in current month or year of age.                                                                                                                                                       | Population per death in age interval. | Sum of numbers in column 6 in current and all older age intervals. | Average annual death rate per thousand of population in current and all older age intervals. |

## THE DISTRICT OF COLUMBIA: 1901-1910.

## TABLE 35

REPORTED DEATHS IN 1901 (1,321), IN 1902 (1,299), IN 1903 (1,266), IN 1904 (1,326), IN 1905 (1,419), IN 1906 (1,439), IN 1909 (1,325), AND IN 1910 (1,429).

Illustrative examples, showing how to use the tables, are given on pages 29 to 40.

| AGE<br>INTERVAL.                                    | OF 100,000 MALES BORN<br>ALIVE:                  |                                  | RATE OF<br>MORTALITY<br>PER<br>THOUSAND.                                                      | COMPLETE<br>EXPECTATION<br>OF LIFE.                                                          | STATIONARY MALE POPULATION,<br>Unaffected by Emigration and Immigration, which, Assuming the Mortality Rates in Column 4,<br>would result if 100,000 Males were Born Alive Uniformly Throughout Each Year. |                                             |                                                                               |                                                                                                                 |
