

# AMERICAN-CANADIAN MORTALITY INVESTIGATION

BASED ON  
THE EXPERIENCE OF LIFE INSURANCE COMPANIES  
OF THE UNITED STATES AND CANADA  
DURING THE YEARS 1899 TO 1912, INCLUSIVE  
ON POLICIES ISSUED FROM 1848 TO 1914, INCLUSIVE

VOLUME II

CONDUCTED AND PUBLISHED BY  
THE ACTUARIAL SOCIETY OF AMERICA  
WITH THE COÖPERATION OF  
THE AMERICAN INSTITUTE OF ACTUARIES

1919

## COMMITTEE OF THE NATIONAL CONVENTION OF INSURANCE COMMISSIONERS

After the text of Volume II had been completed and approved by the committee of the Actuarial Society and was ready for criticism and suggestions by the members of the other two committees, it was found that four members of the committee of the National Convention had resigned from State service, one vacancy having been filled by a recent appointment. In order to get the opinion of that committee, therefore, it would have been necessary to appoint three new members none of whom had any knowledge of the work connected with Volume I. Furthermore, the investigations contained in Volume II did not come within the scope of the work for which the committee of the Convention of Insurance Commissioners had been appointed, as the mortality table based upon the experience in the United States had been completed and published in Volume I. The Commissioners' committee, therefore, decided that it was inexpedient to take any part in the preparation of Volume II.

# AMERICAN-CANADIAN MORTALITY TABLES

## VOLUME II

### MORTALITY ACCORDING TO PLAN OF INSURANCE

An investigation of the relative mortality under the principal plans of insurance was undertaken. These are ordinary life, 20 payment life, 20 year endowment, and 10 year term—renewable and non-renewable. It was deemed advisable to include (1) with the ordinary life, the endowment insurances maturing at age 80 or over; (2) with the 20 payment life, the 10 payment life and also the 15 and 20 payment endowment insurances maturing at age 80 or over; (3) with the 20 year endowment insurances, the 15 year endowment insurances, both maturing at ages under 80.

The investigation was confined to data on American men, a study of mortality among women according to plan of insurance having already been made in connection with the Medico-Actuarial Mortality Investigation, (Vol. II, pages 36-41). Canadian actuaries were consulted regarding an investigation of the mortality by plan of insurance for Canadian men, but it was deemed unnecessary to incur the additional expense in view of wartime conditions.

In determining the expected deaths the select and ultimate rates of mortality for American Men (AM) were used. The select rates allow for the effect of selection during the first five insurance years, the ultimate rates applying to the experience of the sixth and subsequent insurance years. These mortality rates are given on pages 182-183.

The Exposed to Risk, Actual Deaths and Expected Deaths for the first five insurance years are based on ages at entry 15 to 65, inclusive, and for the sixth and subsequent insurance years on all ages attained.

Synopsis of the results follows:

#### ORDINARY LIFE PLAN AMERICAN MEN

| FIRST FIVE INSURANCE YEARS |               |                 |                                    |
|----------------------------|---------------|-----------------|------------------------------------|
| AGE AT ENTRY               | ACTUAL DEATHS | EXPECTED DEATHS | RATIO OF ACTUAL TO EXPECTED DEATHS |
| 15-24                      | 8544,000      | 4465,000        | 116.8%                             |
| 25-34                      | 2,678,400     | 2,458,000       | 108.9                              |
| 35-44                      | 5,834,000     | 4,694,000       | 120.0                              |
| 45-54                      | 7,026,000     | 6,642,400       | 105.8                              |
| 55 and over                | 4,621,600     | 4,811,000       | 96.1                               |
| Totals                     | \$20,505,400  | \$19,062,200    | 107.6%                             |

| 3                          | 4,182,200     | 3,799,400       | 110.4                              |
| 4                          | 4,104,500     | 3,977,000       | 103.2                              |
| 5                          | 4,400,300     | 4,292,300       | 102.5                              |
| 6 and subsequent           | 288,766,300   | 288,546,900     | 101.8                              |
| Totals                     | \$309,271,700 | \$308,609,100   | 102.2%                             |

Compared with the average for all plans of insurance combined the mortality under ordinary life policies is approximately 8 per cent. higher for the first five insurance years and 2 per cent. higher for the sixth and subsequent insurance years. Excluding the youngest age group where the statistics are not numerous, the highest relative mortality appears at entry ages 35 to 44 for the first five insurance years combined, and at attained ages 30 to 39 for the sixth and subsequent insurance years. It may be said that at the older ages at entry and the older attained ages the mortality is practically the same as for all plans of insurance combined, but this is merely the result of the fact that at these ages the data on ordinary life insurances comprised the great bulk of the total data.

| <b>Totals</b>                     | <b>\$91,391,100</b>  | <b>\$96,897,500</b>    | <b>94.3%</b>                              |

The ratio of actual to expected deaths for the first five insurance years combined is 92 per cent., and for the sixth and subsequent insurance years combined it is 95 per cent. An inspection of the results by ages at entry and by attained ages indicates that the relative mortality was rather better in the early than in the later insurance years.

If the percentages derived from the ordinary life experience are applied to the exposures under the limited payment life experience, it will be found that the relative mortality is about 12½ per cent. better on the limited payment than on the ordinary life plan, the difference between the two being greater in the earlier than in the later insurance years.

| <b>Total</b>               | <b>\$30,728,300</b> | <b>\$32,191,100</b> | <b>95.5%</b>                       |

The ratio of actual to expected deaths appears to be slightly higher for the 19 and 20 year endowment insurances than for the policies on the 19 and 20 payment life plans. If the percentages derived from the latter are applied to the exposures on the former, thus taking account of the distribution by age at entry and by insurance year, the relative mortality under the endowment insurance is 74½ per cent. higher than under the limited-payment in the first five insurance years and practically the same for the sixth and subsequent insurance years.

The following deductions may be made from the three tables: First, that the mortality on the limited payment and endowment policies has been lower than on policies issued on the ordinary life plan; second, that the mortality on 19 and 20 year endowment insurances has not been quite as good as on the 19 and 20 payment life policies, but the amount of data is not large enough to eliminate fluctuations; third, that the differences are less than was generally anticipated, and much less than in the British Office Life Tables, 1899.

The lower mortality on 19 and 20 payment life policies than on 19 and 20 year endowment insurances is a new feature in American experience; the British experience also shows a slightly lower mortality on limited-payment life than on endowment insurances. One reason advanced for this result in the case of the American companies is that there has been a tendency to limit slightly impaired or border-line risks to endowment insurances.

It may be of interest to record that, combining the four classes of women whose mortality was studied under the Medico-Actuarial Mortality Investigation, the ratio of actual to expected deaths was 121 per cent. on the ordinary life plan, 100 per cent. on the limited-payment life plan, and 89 per cent. on the endowment insurance plan.

#### 10 YEAR NON-RENEWABLE OR 10 YEAR RENEWABLE TERM POLICIES RUNNING AS TERM INSURANCE FOR A PERIOD NOT EXCEEDING 10 YEARS

Since the data in this section include only the exposures under the original 10 year term, the effects of any adverse selection which may have affected results after renewal for a further period were excluded. The results appear in the next table.

| Totals                      | \$4,751,900   | \$4,648,700     | 102.2%                             |

For all ages and durations combined, the relative mortality was the same as under ordinary life policies, but was lower in the early and higher in the later policy years.

It seems apparent that the mortality under term insurance issued by the companies in recent years has been satisfactory. This is very probably due to the stricter selection which has been exercised by many companies in the acceptance of risks for term insurance. Many companies issue term insurance only if the risks are considered better than the average. It should therefore be remembered that the fact that the mortality was as favorable as under ordinary life policies must not be taken to indicate that if a free selection by the insured were permitted the results would be as satisfactory.

**10 YEAR NON-RENEWABLE OR 10 YEAR RENEWABLE TERM POLICIES  
 CONVERTED OR CHANGED WITHOUT A NEW MEDICAL EXAMINATION  
 BEFORE THE END OF THE ORIGINAL TERM PERIOD**

An investigation was made to determine the relative mortality among policies converted or changed from 10 year non-renewable or 10 year renewable term to any other plan before the end of the original term period, without a new medical examination. The total amount of data in this investigation was not large, but considerable labor was involved, because it was deemed advisable to determine the mortality according to the number of calendar years elapsed between the year of issue and the year in which the change or conversion was made. The mortality was investigated by insurance years running from date of change or conversion. In obtaining the expected deaths by the select AM table, however, the mortality rate according to duration from original issue date was taken, as there had been no fresh medical selection at date of change. The following table gives a synopsis of the results:

**10 YEAR TERM CHANGED OR CONVERTED DURING ORIGINAL PERIOD  
 AMERICAN MEN**

**CHANGED DURING 1ST OR 2D CALENDAR YEAR**

| Insurance Years After Change | Actual Deaths    | Expected Deaths  | Ratio of Actual to Expected Deaths |

A high mortality was not to be expected in this class, as the policies were all changed to higher premium plans, and, except for those changed in the later years of the 10 year non-renewable term, the mortality should be normal. Under non-renewable term policies which must be converted not later than one, two or three years prior to the end of the original term in order to effect the change without medical examination, a mortality after conversion higher than the normal may be anticipated, but the statistics were not numerous enough to decide the point.

The synopsis shows a mortality ratio of 88 per cent. for the first five insurance years after change or conversion and 95 per cent. for the sixth and subsequent insurance years. The mortality among policies changed during the fifth to the sixth calendar year of the original 10 year term was about 100 per cent. The analysis by attained ages is not conclusive, because, while the mortality is relatively low at the younger attained ages, the data are small. The mortality is high for attained ages 40 to 49 inclusive during the first five insurance years after change, but abnormally low during the same years for attained ages 50 and over, while the condition is reversed for the sixth and subsequent years after change—results doubtless due to paucity of data.

10-YEAR RENEWABLE TERM POLICIES RENEWED OR CONVERTED  
AT END OF PERIOD

An investigation was made of 10 year term policies which were renewed or changed without medical examination at the end of the original period to determine what selection was made against the company by the insured. The

experience accordingly begins from date of renewal or change of the policy at the end of the original 10 year term period. The expected deaths were calculated by the ultimate rates of mortality. A synopsis of the results follows:

**10 YEAR RENEWABLE TERM POLICIES CHANGED OR RENEWED WITHOUT A  
NEW MEDICAL EXAMINATION AT THE END OF THE ORIGINAL PERIOD  
AMERICAN MEN**

**FIRST FIVE INSURANCE YEARS AFTER RENEWAL OR CHANGE**

**ALL INSURANCE YEARS AFTER RENEWAL OR CHANGE**

| ATTAINED AGE  | ACTUAL DEATHS      | EXPECTED DEATHS    | RATIO OF ACTUAL<br>TO EXPECTED DEATHS |
|---------------|--------------------|--------------------|---------------------------------------|
| Under age 60  | \$1,368,500        | \$1,367,800        | 100.1%                                |
| 60 and over   | 668,100            | 610,800            | 109.8                                 |
| <b>Totals</b> | <b>\$2,036,600</b> | <b>\$1,978,600</b> | <b>103.4%</b>                         |

The mortality after renewal or change seems to have been satisfactory at attained ages under 60. The mortality for the first five insurance years is 14 per cent. above the normal for attained ages 50 to 59 and 29 per cent. at ages 60 and over. For all ages under 60 combined the mortality is 100 per cent. of the ultimate rates, and for ages 60 and over, 121 per cent. Such results are in accordance with expectation, because the older the insured the higher is the premium and the less the incentive to renew the term policy or change it to a higher priced plan if the insured is in good health.

# MORTALITY ACCORDING TO HABITAT IN THE UNITED STATES

The members of each of the committees were asked to suggest a division of the United States into several groups of states. As a result ten groups of the states were agreed upon. There was practically no difference of opinion with regard to these groups with the exception of the proper group into which to place the State of Missouri. An investigation was accordingly made of the experience in that state for the sixth and subsequent insurance years, which indicated, so far as the mortality was concerned, that it belonged to the group of states to the northeast of it. It will be seen from the following list that the grouping of the states took account of their geographical situations and economic conditions. The groups were as follows:

1. Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.
2. New Jersey, New York, Pennsylvania.
3. Delaware, District of Columbia, Kentucky, Maryland, North Carolina, Tennessee, Virginia, West Virginia.
4. Illinois, Indiana, Michigan, Missouri, Ohio, Wisconsin.
5. Florida, Georgia, South Carolina.
6. Alabama, Arkansas, Louisiana, Mississippi.
7. Iowa, Kansas, Minnesota, Nebraska, North Dakota, South Dakota.
8. Oklahoma, Texas.
9. Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming.
10. Alaska, California, Oregon, Washington.

In the following exhibit appears a synopsis of the actual and expected deaths for each of the first five insurance years and also for the sixth and subsequent insurance years combined.

The states showing the lowest relative mortality are those in Group (7), while the states with the highest mortality are those in Groups (3) and (5). The mortality results are so similar in the two latter groups that the data could have been combined without disadvantage.

It appears that the Eastern, Middle and Pacific Coast States show a higher relative mortality in the sixth and subsequent insurance years than in the first five insurance years, while the reverse is true of the Rocky Mountain, South-eastern and Southern States. In general, the older settled states and those containing the large cities show a lower relative mortality in the earlier than in the later insurance years, while the reverse is true in the other states.

In the following table appears a synopsis of the habitat mortality by age at entry for the first five insurance years combined, and by attained age for the sixth and subsequent insurance years combined.

Care should be taken to examine the amount of data before drawing any deductions. On account of the paucity of material in certain of the sections when subdivided, as shown in the foregoing table, the ratios of actual to expected deaths may exhibit considerable accidental fluctuations. Due consideration should be given to the relative proportion of business in the early compared with the later insurance years. In Group 2, for example, the expected deaths for the sixth and subsequent insurance years are about twelve times those for the first five insurance years combined, whereas in Group 8 the expected deaths for the sixth and subsequent insurance years are only two and a half times as large as the expected deaths for the first five insurance years.

## MORTALITY ACCORDING TO HABITAT IN CANADA

An investigation was made of the mortality among Canadian men according to their residence at date of application for insurance. At the suggestion of the Canadian actuaries, the following divisions were made:

Ontario.

Quebec.

Nova Scotia, New Brunswick and Prince Edward Island.

Manitoba, Alberta and Saskatchewan; Yukon Territory.

British Columbia.

The original intention to investigate the mortality in the Yukon Territory separately was not found feasible as the amount of data was very limited; the total death claims in the first five insurance years were \$11,000, and for the sixth and subsequent insurance years, \$2,500. The data for that territory were therefore combined with those for the provinces of Manitoba, Saskatchewan and Alberta. In the following table is given a synopsis by insurance years of the mortality in the several groups. The expected deaths were based on the C<sup>2</sup> table. The mortality rates by this table appear on pages 184-185.

The mortality in Manitoba, Alberta and Saskatchewan is lower than in any of the other sections. In British Columbia the high mortality of 133 per cent. in the first five insurance years is largely due to a death loss for \$100,000; for the sixth and subsequent insurance years the mortality in that province was very slightly higher than for the group of the three western provinces. The mortality in the Maritime Provinces is less than the average in the whole of Canada for the first five insurance years, but higher thereafter.

The significant result of the investigation is the high mortality in the Province of Quebec, which appears in all insurance years. It is 25 per cent. higher than the mortality in Ontario. A higher mortality was expected in the Province of Quebec because the mortality among the French-Canadian population is known to be higher than among other Canadians. As will be shown, the mortality among women in Quebec is also higher than among other Canadian women.

In the following table appears a synopsis of the mortality by ages at entry for the first five insurance years combined, and by attained ages for the sixth and subsequent insurance years combined.

The outstanding features of the foregoing synopsis are that the mortality in the Province of Quebec is consistently high in the various insurance years and at the different ages, while in the Provinces of Manitoba, Saskatchewan and Alberta it is favorable at all ages, the same being true in the case of British Columbia, with some exceptions due perhaps to the paucity of data. The mortality in the first mentioned province is 33 per cent. higher than in the four western provinces combined.

If the expected deaths had been calculated by the AM Table instead of the CM the ratio of actual to expected deaths would have been approximately as follows:

RATIO OF ACTUAL TO EXPECTED DEATHS BY AM TABLE

|                                                           | For 5 Insurance Years | For 10 and 15th Insurance Years | All Insurance Years |
|-----------------------------------------------------------|-----------------------|---------------------------------|---------------------|

#### MORTALITY AMONG WOMEN IN THE PROVINCE OF QUEBEC

At the request of the Canadian authorities an investigation was made of the mortality among women insured in the Province of Quebec by either Canadian or American companies. Owing to the unsatisfactory experience of some companies the insurance of women in that province had been restricted. A synopsis of the results of this investigation follows:

WOMEN INSURED IN THE PROVINCE OF QUEBEC  
EXPECTED DEATHS CALCULATED BY CM TABLE  
FIRST FIVE INSURANCE YEARS

| AGE AT ENTRY | ACTUAL DEATHS | EXPECTED DEATHS | RATIO OF ACTUAL TO EXPECTED DEATHS |
|--------------|---------------|-----------------|------------------------------------|
| 34 and under | \$34,000      | \$15,500        | 226.7%                             |
| 35 and over  | 22,500        | 14,400          | 156.3                              |
| Totals       | \$56,500      | \$29,900        | 192.2%                             |

| 60 and over | 117,800       | 144,700         | 81.3                               |
| Totals      | \$214,600     | \$212,200       | 100.9%                             |

ALL AGES AT ENTRY COMBINED

| Insurance Year   | ACTUAL DEATHS | EXPECTED DEATHS | Ratio of Actual to Expected Deaths |
|------------------|---------------|-----------------|------------------------------------|
| 1                | \$19,000      | \$5,600         | 339.3%                             |
| 2                | 13,000        | 5,800           | 224.1                              |
| 3                | 9,000         | 5,800           | 155.2                              |
| 4                | 7,500         | 6,000           | 125.0                              |
| 5                | 8,000         | 6,200           | 129.0                              |
| 6 and subsequent | 214,200       | 212,200         | 100.9                              |
| Totals           | \$270,700     | \$241,600       | 112.0%                             |

While the mortality is about 12 per cent. in excess of the standard for Canada, it should be remembered that the mortality among all Canadian women was about 10 per cent. lower than among Canadian men, and that, therefore, the mortality among Quebec women is about 25 per cent. higher than among Canadian women as a whole.

A comparison of the mortality among women insured in the Province of Quebec with the mortality among men under the same conditions does not show a material difference in the relative mortality for the entire experience, but the mortality among the men is distinctly higher than among the women after the fifth insurance year. The mortality among women in Quebec is in excess of the normal for Canadian women appears in the early insurance years, the mortality after the fifth insurance year for attained ages 40 and above being satisfactory.

While the amount of data for the women is not large, the results are probably a true indication of the mortality, as they are confirmed by the investigations of individual insurance companies.

## CAUSES OF DEATH

An investigation has been made into the causes of death in the case of American men and of Canadian men. The deaths according to cause have been tabulated in two ways:

- (1) Percentage from each cause of total deaths from all causes.
- (2) Death rate from each cause per \$10,000 exposed to risk.

The first method is generally used, because the statistics seldom permit of the use of the second, but the results are affected by variations in the total mortality from all causes, as well as by variations in the mortality from the individual cause in question. The second form of tabulation shows the absolute effect of variations in the mortality from each cause independently and is, therefore, of greater value to insurance companies.

In the tables appear the deaths tabulated by cause and by attained age, subdivided by insurance years. The causes listed are the same as those in the Medico-Actuarial Mortality Investigation, supplemented by a few in which the particular cause was responsible for at least one per cent. of the total deaths in any group of ages. In the Medico-Actuarial Mortality Investigation the deaths were tabulated by ages at entry, but it seemed advisable in the present investigation to group them by attained ages.

In the following exhibit appears a synopsis of the nine principal causes of death, for both American men and Canadian men for groups of attained ages and for certain insurance years. There are irregularities in the tables, which are unavoidable in the case of investigations based on amounts insured:

# AMERICAN-CANADIAN MORTALITY EXPERIENCE DEATHS BY CAUSE

The rate per \$10,000 exposed to risk, which will be referred to as the death rate, exhibits the well-known condition of an increasing death rate with advancing age from such diseases as cancer, cerebral hemorrhage and apoplexy, organic diseases of the heart and nephritis. The death rate from typhoid fever is shown as decreasing until after middle life. In the case of pneumonia, an increase in the death rate accompanies advancing age.

Only a general comparison of death rates by causes as shown in the present investigation and in the Medico-Actuarial Mortality Investigation is practicable, owing to differences in methods of tabulation. In the case of typhoid fever, there is a striking difference in the mortality rates, those of the current investigation being much lower.

In the case of tuberculosis of the lungs, there appears a marked improvement in the first-year experience as shown by the present investigation over the corresponding results of the Medico-Actuarial.

In the Medico-Actuarial as well as in the present investigation the death rate from accident shows on the whole a tendency to decrease with duration of policy notwithstanding the increased age, and yet to increase for any given duration with the age attained.

As it was difficult to make a comparison between the relative deaths from various causes among American and among Canadian men, the expected deaths among Canadian men were calculated on the basis of the death rates per thousand exposed to risk among Americans. In other words, the total expected death losses among Canadian men were obtained for each of the nine principal causes according to the rates found among American men. The outstanding features of this investigation were markedly greater death rates among Americans than among Canadian men from cerebral hemorrhage and apoplexy, organic diseases of the heart, diabetes, nephritis and Bright's disease and a slightly greater death rate in the case of pneumonia. In the case of accident the Canadian death rates were the higher.

## MORTALITY UNDER POLICIES FOR LARGE AMOUNTS

The companies supplied the initials and the date of birth of the insured where insurance of \$50,000 or more was effected on one application, in order that an investigation might be made of the mortality on policies for large amounts on individual risks. Unfortunately, the amount of data is small because a small part only of the statistics of the large companies was included. It will be remembered that for the years of issue 1900 to 1914 inclusive, the larger the company the smaller was the proportion of data contributed. The younger companies which contributed their entire data had very little experience on policies of \$50,000 or more.

The investigation was divided into two parts, (a) insurances for \$50,000 or more on individual lives; (b) insurances of \$100,000 or more on individual lives taken out in amounts of at least \$50,000 per policy. The investigation was limited to the data on American men, the expected deaths being measured by the AM table. On account of the limited amount of data only the following synopsis of the two investigations are given:

| 6 and sub-<br>sequent | 1,825,500            | 1,353,400                              | 143.0                                         |
| <b>Totals</b>         | <b>\$3,595,500</b>   | <b>\$1,078,100</b>                     | <b>131.2%</b>                                 |

In accordance with expectation, the mortality was higher than normal, about 17 per cent. in excess of the A.M. table on policies for \$50,000 or more and about 31 per cent. on policies of \$100,000 or over, on individual lives.

From the two tables there can be deduced the experience on cases for \$50,000 but less than \$100,000. The expected death losses on this group would be \$3,634,400, and the actual, \$3,828,300, a ratio of actual to expected of 109 per cent.

As the committee's data were not extensive, three of the large companies were asked to supply their experience. One of these informed the committee that under policies issued from 1880 to 1915, for an aggregate amount within a single calendar year of \$100,000 or more on individual lives, the mortality was about 25 per cent. in excess of the normal mortality of the company on all its insurance. The data were more than three times as large as in the American-Canadian experience.

In 1909 another company investigated its experience on lives insured for \$50,000 or more, covering issues from 1868 to 1907, inclusive, carried to the anniversaries in 1908. The experience was confined to the sections in which no special adverse mortality had been experienced. With this object in view all tropical territory was excluded, also southern and eastern Europe and the Southern States. The standard adopted as a basis of comparison was the American Experience Table modified to cover selection. The modification consisted in assuming a graded scale of percentages for different years of duration, the first year percentage being 50, increasing to 35 for the sixth to tenth years inclusive, and to 100 per cent. for the subsequent years. On this basis the percentage of actual to expected deaths on lives insured from \$50,000 to \$99,999, inclusive, was 107.5 per cent., and on those insured for \$100,000 and over it was 113.2 per cent., the general average being 109.1 per cent. These percentages are by lives, the corresponding percentage by amounts being 165.7, 113.9 and 109.8. Dividing the experience by age at issue, the percentage of actual to expected deaths by lives on policies issued at ages under 40 was 102.9, and for those issued over 40, 111.3.

Dr. Brandreth Symonds, chief medical director of the Mutual Life Insurance Company, addressed the Association of Life Insurance Medical Directors at their annual meeting held in January, 1919, on "The Mortality Experience on Risks Insured for \$50,000 and Upwards on One Application." The statistics covered policies issued during the years 1885 to 1915 inclusive, observed to the policy anniversary in 1916. The statistics were divided into three classes, depending upon the aggregate amount of insurance on each individual life if issued in one application: (1) \$50,000 to \$100,000 inclusive; (2) over \$100,000 to \$250,000 inclusive; (3) over \$250,000. The following is a synopsis of the results, the expected deaths being calculated by the Medico-Actuarial Mortality Table.

#### ISSUES OF 1885 TO 1915 INCLUSIVE

| BY AMOUNTS INSURED |                     |                     |                                    |
| 1                  | \$18,015,100        | \$17,207,157        | 105%                               |
| 2                  | 2,893,100           | 2,746,379           | 98                                 |
| 3                  | 2,828,200           | 960,512             | 288                                |
| <b>Totals</b>      | <b>\$23,537,500</b> | <b>\$20,914,048</b> | <b>113%</b>                        |

Classes 2 and 3 are small. If combined, the mortality would be 110 per cent. by applications and 148 per cent. by amounts insured.

In his paper, Dr. Symonds gives the experience by causes of death, and also the distribution by build groups among the risks for large amounts compared with the general experience of the company. He also shows the experience of the Mutual Life with regard to steady free users of alcohol. As the result of his study he suggests that the following inferences be drawn:

"1. Applicants for large amounts regularly eat and drink more than the average and more than they ought to.

"2. This class is more subject than the average to the interested intrusion of unsound lives, whether this unsoundness be due to finances, health or habits.

"3. The most elaborate investigation will not always reveal the truth as to finances and habits, but the more rigid it is, the better is the result.

"4. The most careful medical examination should be instituted to exclude the faintest beginnings of the degenerative diseases. Large risks are subject to these and die of them, even if they are young or lean.

"5. Even with the utmost care in examination, investigation and selection, the large risks will not show as low mortalities as in the general experience of a first-class company among its standard lives, for they eat and drink too much."

It seems to be certain that the mortality among large risks taken at one time is higher than the average of the companies for risks of all amounts. It is probable, on the other hand, that the mortality on cases of from \$50,000 to \$100,000 inclusive on persons who have gradually increased their insurance as their means permitted, over a series of years, would be satisfactory. There is a general belief that a good mortality could be obtained on policies of \$100,000 or more taken in one application, provided the so-called moral hazard could be eliminated, and provided men who had overworked in attaining their wealth could also be eliminated. At the present time there is probably a smaller proportion of cases involving moral hazard in connection with applications for large amounts than in previous years, as many men are now making provision for payment of inheritance taxes through insurance, and as it has become a commercial practice to insure for the benefit of the corporation the employees who are necessary for its success.

Note.—Owing to the large proportion of losses prior to 1900 class of substandard losses entering into this experience, the actual experience for insurance years do not show the normal reduction with increasing duration. In the Eastern States, in which losses prior to 1900 were high, the experience for insurance years is consequently not always greater than in the next year. The above figures show that the first

| 46           | 3,223,600        | 16,700        | 30,200          |              |                  |                 |                 |
| 47           | 3,856,100        | 58,500        | 28,800          |              |                  |                 |                 |
| 48           | 2,433,400        | 7,000         | 25,600          |              |                  |                 |                 |
| 49           | 2,562,100        | 30,000        | 28,200          |              |                  |                 |                 |

Amounts for life insurance earned were greater for the closed class in the second insurance year, and greater in the fourth than in the third, due to the return premium.

(See vol. 2, page 207.)
